AQUIFER MAPPING AND MANAGEMENT OF GROUND WATER RESOURCES

**Bhavnagar District
Gujarat**

पश्चिम मध्य क्षेत्र, अहमदाबाद
West Central Region, Ahmedabad

ACKNOWLEDGEMENT

I would like to take an opportunity to thank Shri G. Krishnamurthy, Regional Director, CGWB, West Central Region, Ahmedabad and Shri Sanjeev Mehrotra, Scientist-D, CGWB, West Central Region, Ahmedabad, Gujarat for offering such opportunity of detailed study of the district. I am very much delighted to express my deep sense of gratitude and regards to my respected colleagues/ seniors Dr. A. K. Jain Scientist-D (Retired), Sh Ramesh Jena, Scientist-B, Sh L N Damodra, Scientist-B, Sh Satyendra Kumar, Scientist-B, Sh Ankit Vishwakarma, Scientist-B, Sh Kamar Ujjam Khan, Scientist-B, Sh Gajanan Ramteke, Scientist-B, Sh Saddam Husain, AHg, Sh Subhash Singh, AHg, Sh Abdurrahman, AHg, and Sh Avinash Chandra STA (HG), WCR, Ahmedabad for their valuable and meticulous guidance and support during the study.

I am deeply thankful to Smt Puja Mehrotra, Scientist-D, Dr. H. B. Meena Asst Chemist, Smt Adiba Khan STA (Chem), and all other scientists of chemical team for timely analysis of the water samples of the district.

I would like to extend my gratitude to Shri Neelesh Dokia, Draftsman, for suggested map preparation. The help and co-operation of all Scientists, staffs, MTS of CGWB, WCR, Ahmedabad is greatly recognizable.

Last but not least, I would like to acknowledge my family members for their unselfish sacrifices, constant blessing and moral support at every stage in my life.

Shah Izhar Ahmed
Assistant Hydrogeologist
Central Ground Water Board
West Central Region
Ahmedabad

AQUIFER MAPPING AND MANAGEMENT PLAN OF BHAVNAGAR DISTRICT

1.1 Introduction

Groundwater is the water found underground in the cracks and spaces in soil, sand and rock. It is stored in and moves slowly through geologic formations of soil, sand and rocks called aquifers. Aquifer mapping is a multidisciplinary scientific process wherein a combination of geological, hydrogeological, geophysical, hydrological, and quality data is integrated to characterize the quantity, quality, and sustainability development of ground water in aquifers. The occurrence and movement of ground water in various aquifer systems are highly complex due to the occurrence of diversified geological formations with considerable lithological and chronological variations, complex tectonic framework, climatological dissimilarities and various hydrochemical conditions. Two broad groups of water bearing formations have been identified depending on their hydraulic

properties, Viz. Porous Formations which can be further classified into unconsolidated and semi consolidated formations having primary porosity and Fissured Formations or consolidated formations which are characterized by the absence of primary porosity.

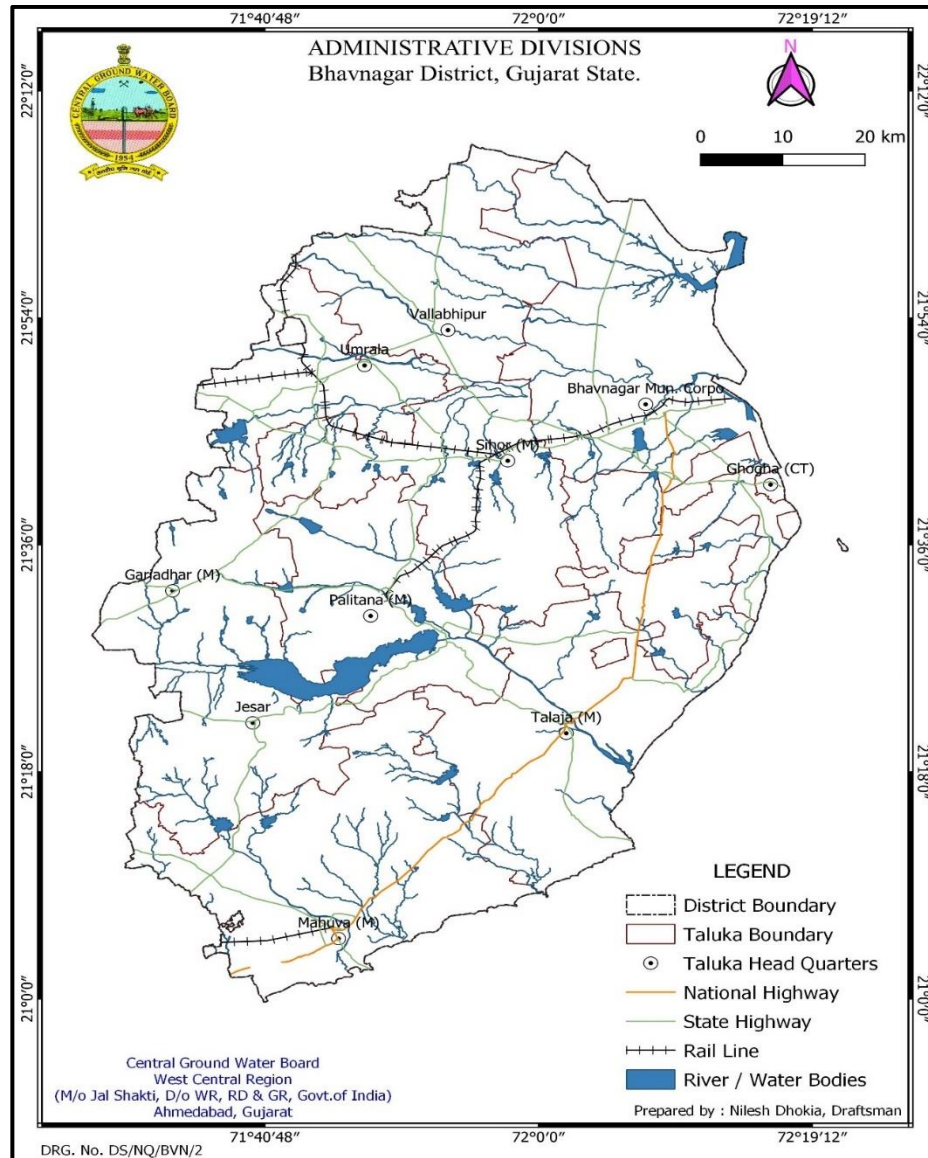

Figure 1 Administrative map of Bhavnagar district

1.2 Objective

The aquifer mapping implemented is primarily based on the existing data that are collected, compiled, analysed and interpreted from available sources. In order to represent the heterogeneity of ground water system, the complexity of aquifer system on map is simplified based on the availability of data for generation of information to be depicted in Aquifer maps broadly representative of the area. The data gap analysis carried out helped in to propose/generate additional data from new data-collection activities such as exploratory drilling, geophysical investigations, water level measurements and groundwater quality analysis. By integrating and analysing the existing data and the data generated, regional hydrogeological maps, thematic maps, water quality maps, cross-sections, 2-D and 3 -D aquifer dispositions and maps of the potentiometric head were generated. Theses maps were utilized for defining the aquifer geometry and assessment of ground water resources and planning possible interventions for improvement in groundwater scenario.

1.3 Scope of the Study

Scope of the study is limited to the extent defining the geometry of aquifer system in space i.e., lateral and vertical disposition of aquifer system, based on existing available data. Defining characteristics of aquifer system wherever available and its significance in development and management of ground water resources in terms of quantity and quality of groundwater of the area depicting ground water regime in Two- and Three-dimension form for understanding & quantification of ground water resources in space, demand and supply of ground water and its use in the area. Identification of issues related with development and use of ground water to meet the competing water demand and its depiction for addressing the issue. Groundwater management strategies for addressing the issues by introducing management intervention (on demand and supply side) into the system. Finally, it is the user, whose participatory approach and perspective of ground water development, use and management based on available Aquifer information system as a stakeholder is envisaged.

1.4 Approach and Methodology

Methodology involves creation of database for each of the principal aquifer. Delineation of aquifer, Aquifer Geometry and their characteristics, integration of Hydrogeological, geophysical, geological, hydrochemical data on GIS platform, identification of issues, manifestation of issues and formulation of strategies to address the issues by possible interventions at local and regional level.

The activities of the Aquifer Mapping can be grouped as follows

1.4.1 Data Compilation & Data Gap Analysis

One of the important aspects of the aquifer mapping programme was the synthesis of the large volume of data already collected during specific studies carried out by Central Ground Water Board and various Government organizations with a new data set generated that broadly describe an aquifer system. The data were collected from the available sources, analysed, examined, synthesized and interpreted. Predominantly non-computerized data was converted into computer-based GIS data sets and on the basis of available data, data gaps were identified.

1.4.2 Data Generation

There is a strong need for generating additional data to fill the data gaps to achieve the task of aquifer mapping. This was achieved by multiple activities such as exploratory drilling, geophysical techniques, hydro-geochemical analysis, remote sensing, and hydrogeological surveys to delineate multi aquifer system.

1.4.3 Aquifer Map Preparation

On the basis of integration of data generated from various studies aquifers have been delineated and characterized in terms of quality and potential. Various maps have been prepared bringing out details of Aquifers, these are termed as Aquifer maps providing spatial variation (lateral & vertical) in reference to aquifer extremities (i.e., quality & quantity).

1.4.4 Aquifer Management Plan Formulation

A suitable strategy for sustainable development of the aquifer in the area has been formulated. All the above activities under the ground National Aquifer Mapping programme is depicted/elaborated in presented in **Figure 2**.

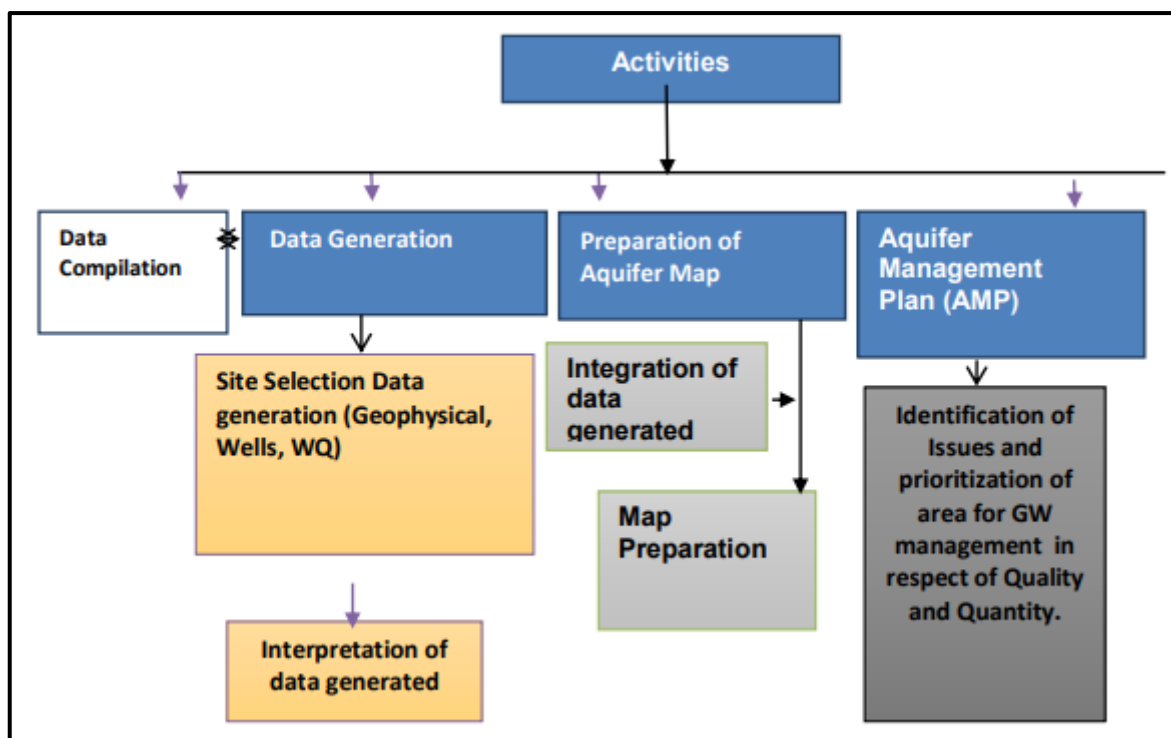

Figure 2 Activities under National Aquifer Mapping Programme

Activities:

Step 1: No activity needed

Step 2: Data generation

Step 3: Aquifer map preparation

Step 4: Preparation of management plan

1.5 Location and Areal Extent

Bhavnagar district has the area of 9980.9 Sq. km and is located in southern part of the Saurashtra Region of Gujarat State. It lies between north latitude 21°18' and 22°18' and east longitudes 71°15' and 72°18'. It falls in the Survey of India (SOI) degreesheets 41O and 46 C. District Bhavnagar is bounded by Surendranagar and Ahmedabad districts of Gujarat in the north, Rajkot and Amreli districts of Gujarat in the west, Arabian Sea and part of Amreli district in the south and the Gulf of Cambay (Gulf of Khambhat) in the east.

1.6 Administrative units, Accessibility, and Population

Administratively, the district is divided into ten talukas viz., Bhavnagar, Gariyadhar, Ghogha, Jesar, Mahuva, Palitana, Sihor, Talaja, Umarala, and Vallabhipur, having total of 693 villages.

The administrative Map of the district is given in **Figure 1**. The Botad taluka from the Bahvnagar district is now become the district itself in 15 August 2013. Gadhada taluka which was in Bhavnagar district previously, is now in Botad district. Mahuva taluka is divided into two talukas, i.e., Mahuva and Jesar taluka. The district headquarter, Bhavnagar, is connected with Ahmedabad through a National Highway NH751. The district is also connected by broad gauge railway line.

Table 1 Area details of parted talukas Jesar and Mahuva

1.7 Previous Work

The study area has been under intensive study by CGWB since 1974. The detailed hydrogeological study carried out by various officers of the department is mentioned below. Systematic Hydrogeological Survey was carried out by shri D.S.K.Rao during FSP 1974 – 77, then by Mandhekar S.M and Pandey A.R in the year 1975 – 77. Later Shri R.C.Jain carried out Systematic Hydrogeological survey during 1983-84. Shri. Arun Kumar and Shri A.Dey carried out during 1883-85 & 1987 – 89 respectively.

Reappraisal Hydro geological surveys were carried out by Shri. A.B.Kawade and Srivastava.N.K during 1984-85 & 1985 – 86 respectively. Exploratory drilling was carried out in Shetrunji Basin during 1981 – 85.

PHYSIOGRAPHY AND DRAINAGE

2.1 Physiography/Geomorphologic Features and Land Forms

The Physiography of the study area features coastal marshes and sandy areas fringing the Gulf of Cambay to the hilly areas of Palitana, and Sihor in the northwest. In the north-western part, hilly upland area ranging between 100 and 296 m AMSL and the slope of the area is towards east. The height of the hill ranges in the south and southwest covering Palitana and Sihor talukas generally ranges in height between 305 and 457 m AMSL. The Shetrunji hills lying southwest of Palitana have the highest elevation of 501 m AMSL. The Geomorphological map of the district is shown in **Figure 3**. These hill ranges lie almost parallel to the coast.

The various geomorphic units occurring with the area classified into two groups:

- Those formed by Quaternary/Tertiary formation that includes alluvial plain, salt flat, valley fill, coastal plain, coastal ridge, coastal depression and piedmont zone.
- Those formed by Deccan trap that includes pediment, dissected hilly terrain, moderately dissected pediplain and denudational hill.

The Alluvial Plain occupies two prominent patches – one in the area south of Shetrunji river and joining the piedmont zone and the other in the Vallbhipur-Umralla region which merges with the salt flats in the west. The drainage in this region is angular, relatively poor and often intersected by lineaments. It comprises of gravel, sand, silt and clay. Though the groundwater development possibility is large in the alluvial plains, however, its quality is unlikely to be potable.

The Salt Flat in the study area is characterised by a thin layer of salt admixed with clay forming flat and extensive surface.

The Piedmont zone exists adjoining dissected hilly terrain. One towards south of Shetrunji river and the other north of Sihor. The contact of piedmont zone with dissected hilly terrain in both the localities appears to be faulted.

The Pediment exists towards the north of Shetrunji river extending northward up to Botad taluka and from Gariyadar taluka in the west to Palitana in the east.

The dissected Hilly Terrain consists of elongated hill ranges of basaltic lava flows representing highly rugged topography. The lava flows are intruded with dykes trending NE-SW, ENE-WSW and NW-SE. The dissected hilly terrain is located in the southwestern, eastern and north-eastern part of Shetrunji river and acts as a basin divide. In regions of moderately dissected Pediplain, numerous dykes exist trending NW-SW, ENE-WSW and NNW – SSE. Drainage is mostly dendritic and stream flows are in southerly and south-easterly directions. There are two denudational hills viz near Palitana and near Mitiala with topographic heights measuring 431 and 473 m amsl.

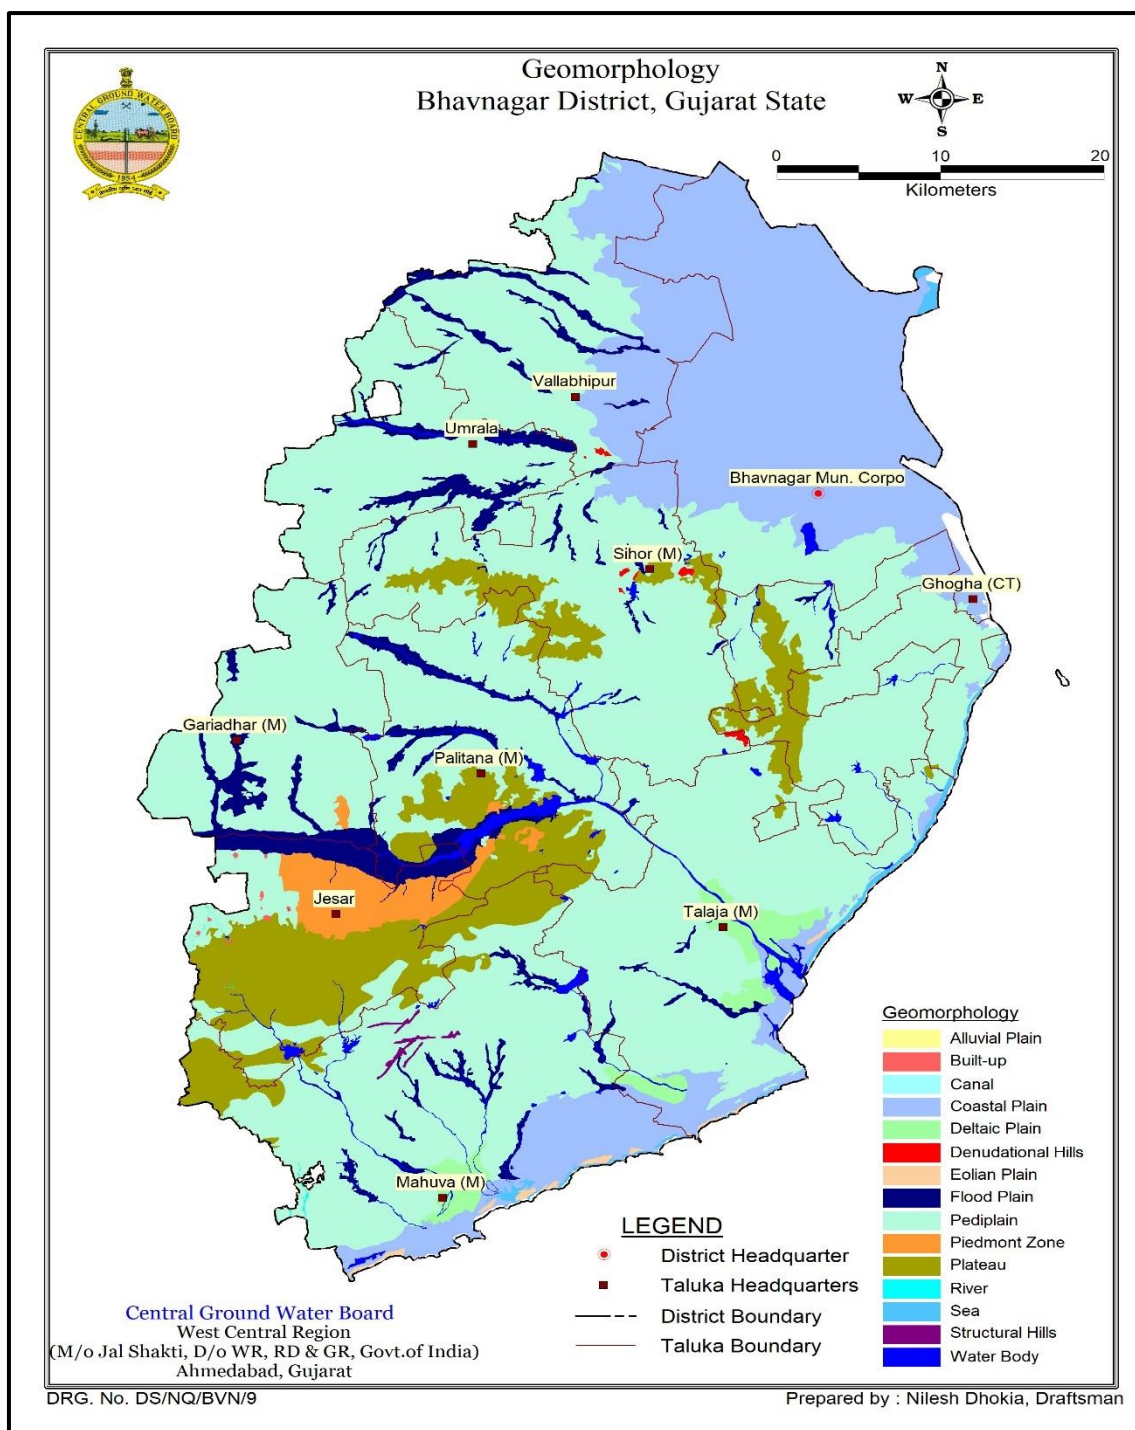

Figure 3 Geomorphological map of Bhavnagar distict, Gujarat state

2.2 Drainage

Bhavnagar district is drained by a number of rivers, namely Shetrunjiriver and its tributaries viz., Kalubhar, Ghelo, Vagad, Kalbi, Padala, Keri, Goma, Utavli, Dhantarvadi, Surajvadi, Melan and Bagad (**Figure 4**). Most streams are ephemeral. The drainage is south-easterly except in Mahuva taluka, where it is drained by southerly flowing streams. Shetrunji is the main river that flows towards Southeast and meets with the Arabian Sea. The river Shetrunji drains the south-central of the district covering Gariadhar, Palitana and Talajatalukas. Originating in the Dundhi hills in the Gir, it enters the district about 1.5 km north of Karjala and flows almost towards east and northeast to east of Palitana and takes a southeasterly turn afterward and debouches in the Gulf of Cambay near Sultanpur. The total length of the river is the district is about 98 km.

The other important rivers that drain the central and northern part of the districts include the Kalubhar, Ghelo, Vagad etc. The above rivers have generally easterly and southeasterly flow and debouch in the marshy land adjoining the Gulf of Cambay in the north-eastern part of the district. The Kalubhar has a total flow length of 45 km, the Ghelo 72 km and the Vagad 38 km in the district. A number of rivers/streams originate and flow in a southerly direction in the southern part of the district south of Shetrunji basin-divide and debouches in the Gulf of Cambay. Important among them are Dhantarvadi, Nadhi, Surajvadi, Nandh, Malan Nadi and Bagad Nadi.

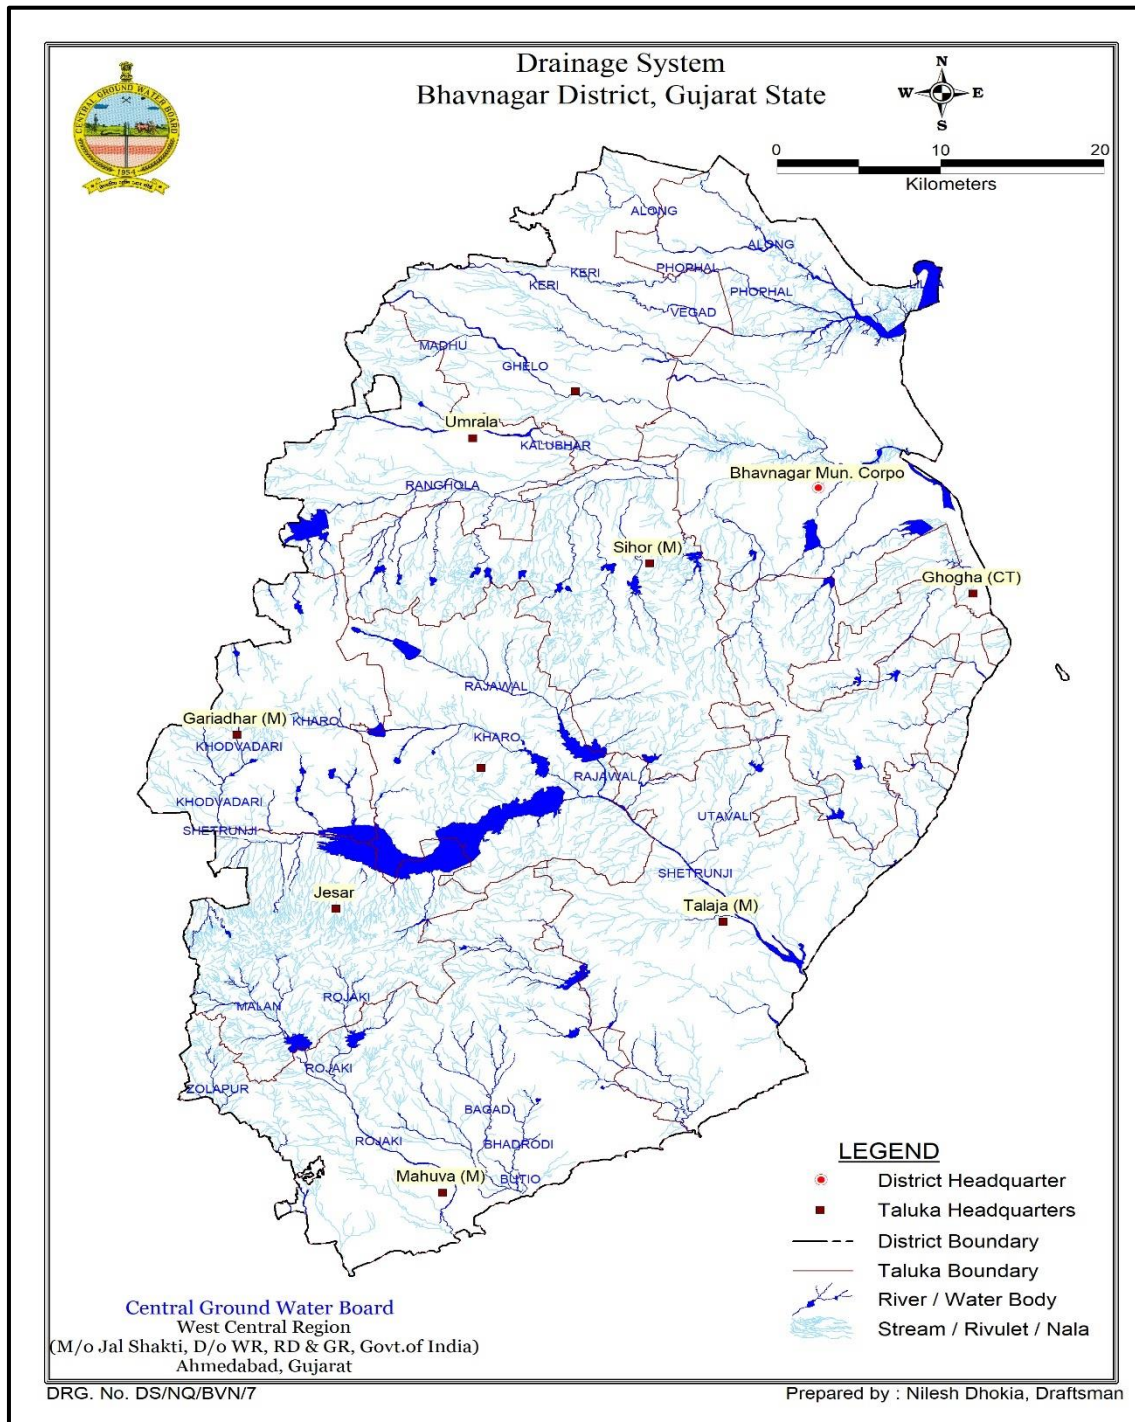

Figure 4 Drainage map of Bhavnagar district, Gujarat state

SOIL, LANDUSE, AGRICULTURE, IRRIGATION AND SURFACE WATER RESOURCES

3.1 Soil

The soils of the district may be broadly classified into following categories

- i) Medium black soils
- ii) Alluvial soils
- iii) Alkaline soils

Medium black soils are wide spread and are found in all the talukas of the district (**Figure 5**). They are more productive and are rich in lime, magnesium and alumina and poor in phosphorous, nitrogen and organic matters. They can retain considerable moisture and are much suitable for agriculture.

Alluvial soils are found along the Shetrunji river covering parts of Gariyadhar and Palitana taluka. Soils in this area are less productive as they are saline. Alkaline soils are found in the parts of Gariyadhar taluka. They consist of both productive and non-productive soils.

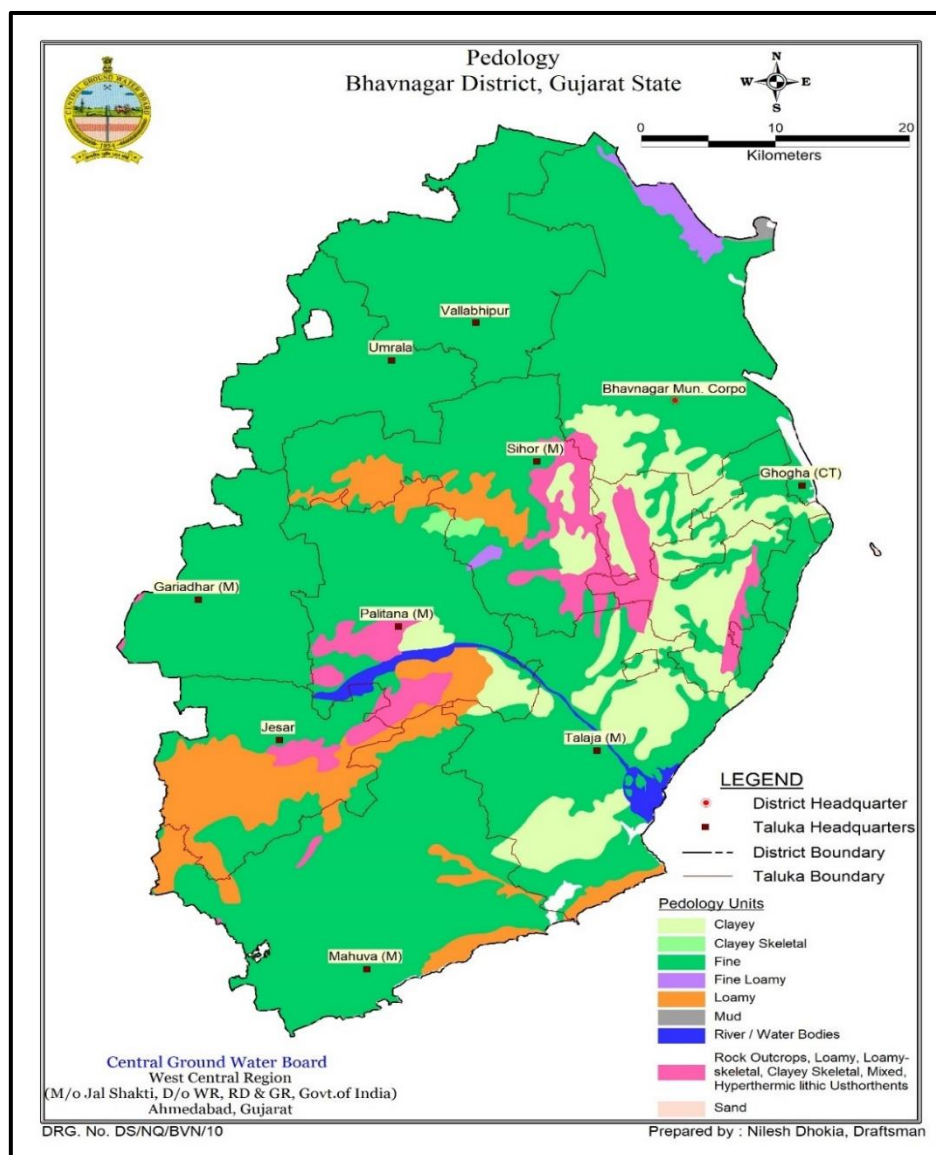

Figure 5 Map showing the soil texture in Bhavnagar district of Gujarat district

3.2 Land Use

As per *Seasons & Crops Record*, 833400 hectares of land, excluding all type of forest & hilly terrain areas, is accounted for land use record. Brief account of land use classification for Bhavnagar district is given in **table 3**. The land use/land cover map of the district is given in **Figure 6**.

Table 3 Bhavnagar District Land use classification

| Land use Classification 2019-20 (Area in 00 Hectare) | | |
|--|------------------------------------|------|
| Total Geographical Area | | 8334 |
| Total Reporting Area | | 6768 |
| Total Forest | | 305 |
| Not available for cultivation | Land put to Non-agricultural uses | 575 |
| | Total Barren and Unculturable Land | 134 |
| Other uncultivated land excluding fallow land | Pasture and other Grazing | 430 |
| | Land under miscellaneous | 02 |
| | Culturable Waste | 481 |
| Fallow Land | Other Fallows | 12 |
| | Current Fallows | 232 |
| Net area sown | | 4597 |
| Area sown more than once | | 861 |
| Gross Cropped area | | 5458 |

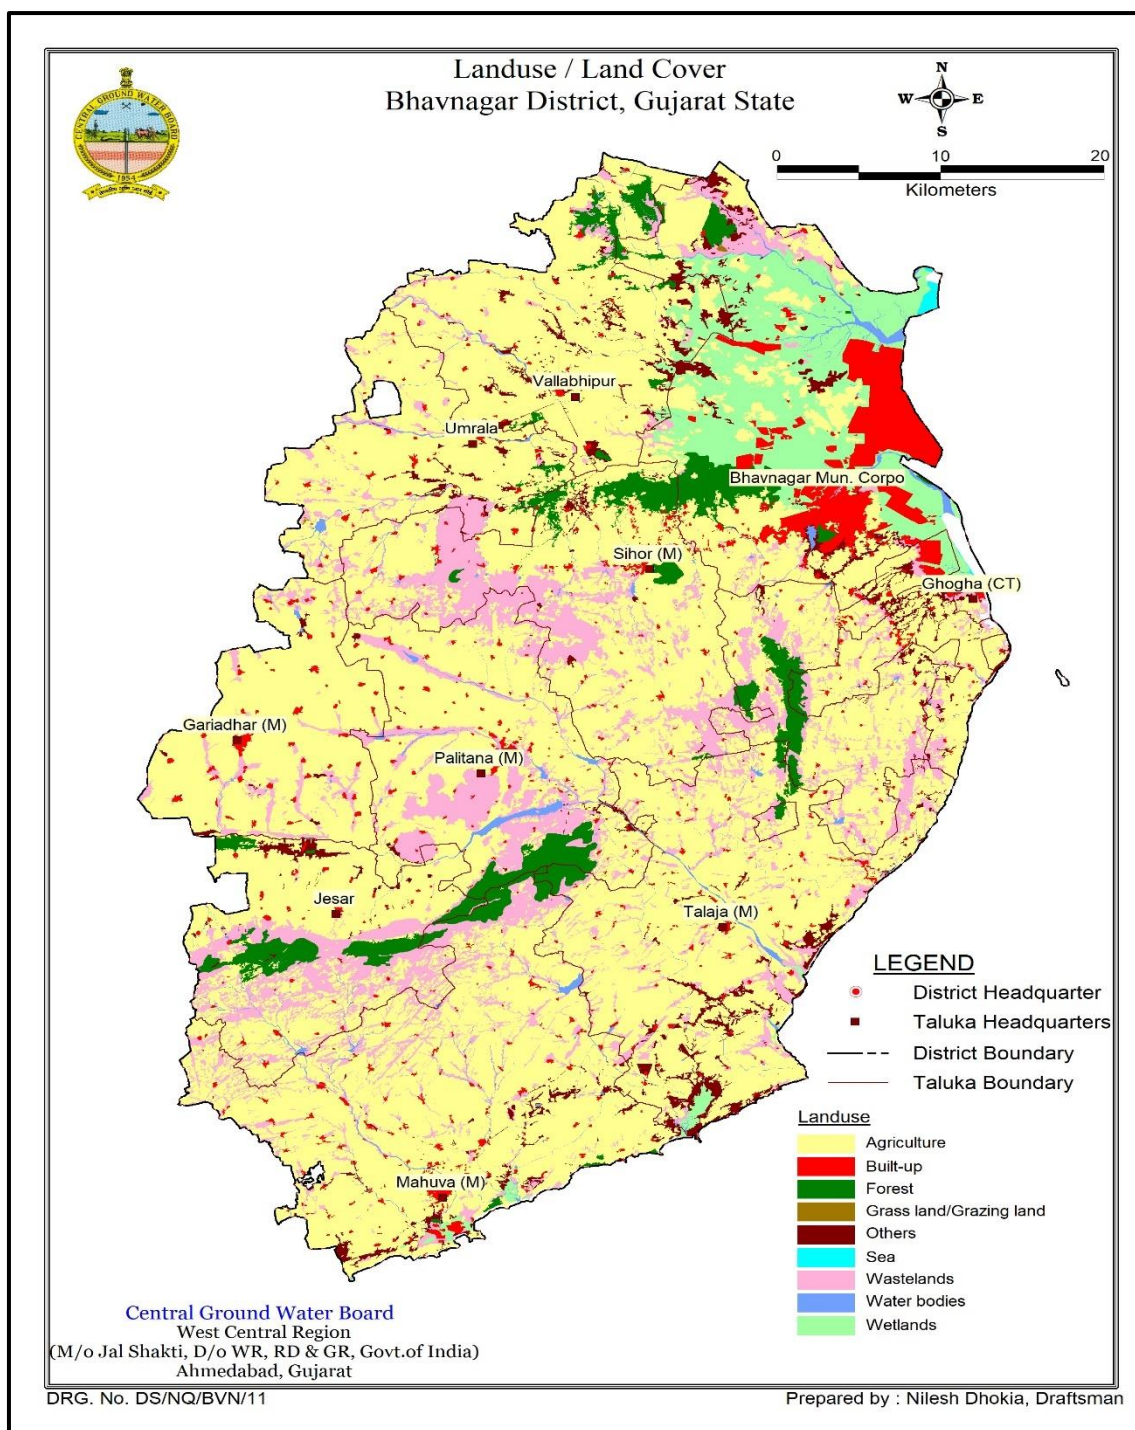

Figure 6 Land use/Land Cover map of Bhavnagar district, Gujarat state

3.3 Agriculture

Bhavnagar district is primarily an agricultural district with cotton, groundnut and wheat as the predominant crops. The other major crops cultivated are Bajra, Sesame, pearl millet, green gram etc. It is interesting to note that the Taluka wise cropping intensity and intensity of irrigated cropping is more than 100% for every Taluka of the district. The crop is divided into two major parts for statistical purpose namely Food and Non-Food crops. The main food crops of the district are Bajra, Wheat and Maize. The main non-food crops are Cotton, Groundnut, Til and Fodder.

3.3.1 Crop Calendar

Month of sowing and harvesting of various crops in the district for the year 2017-18 are given below.

Table 4 Crop calendar of Bhavnagar

| S. No. | Crop | Season | Month of sowing | Time of Harvesting |
|--------|------------------|--------|-----------------|--------------------|
| 1 | Groundnut | Kharif | May-June | Oct-Nov |
| 2 | Cotton | Kharif | May-June | Feb-March |
| 3 | Sesamum | Kharif | June-July | Oct-Nov |
| 4 | Kharif Bajri | Kharif | June-July | Oct-Nov |
| 5 | Wheat | Rabi | Oct-Nov | Feb-March |
| 6 | Onion | Rabi | Oct-Nov | March-April |
| 7 | Cumin | Rabi | Oct-Nov | March-April |
| 8 | Coriander | Rabi | Oct-Nov | March-April |
| 9 | Sorghum | Rabi | Oct-Nov | Jan-Feb |
| 10 | Gram | Rabi | Oct-Nov | Jan-Feb |

3.4 Irrigation

The irrigated area is broadly classified into four classifications namely irrigation by (a) canal, (b) tank, (c) well (including tubewell) and (d) other sources (like Khettalavadi, Boribandh, Checkdam etc.). The detailed description of Irrigation classification of Bhavnagar district is given in table below.

Table 5 Irrigation classification of Bhavnagar district (Source wise)

| Source Wise Irrigation- 2019-2020 (Area '00' Hectare) | | | | | | | | |
|---|--------------|----------------|-------|------|-----------|-------------|---------------|-------|
| | Canal | | | Tank | Wells | | Other Sources | Total |
| | Canals Govt. | Canals Private | Total | | Tubewells | Other Wells | | |
| Net Area Irrigated | 564 | 0 | 564 | 120 | 230 | 779 | 0 | 1693 |
| Gross Area Irrigated | 862 | 0 | 862 | 209 | 320 | 1097 | 0 | 2489 |

3.5 Irrigation Projects: Major, Medium and Minor

In the talukas covering under Bhavnagar district, as such no major or medium scheme exists.

3.6 Surface Water Resources

The study area has only one major irrigation scheme namely Shetrunji. Lot of check dams and percolation tanks have been constructed within the study area for the past five years by the state government departments. A medium irrigation dam has been constructed on Shetrunji River near Rajasthali village, about 8 km south of Palitana town. In addition to the above, two minor irrigation dams have been constructed at Manadavada on Rajaval River and Sonpart on Kharo Nadi. The Kallubhar dam that exists in Gadhada taluka across the Kallubar river is also an important minor irrigation dam. The details regarding the catchment area and reservoir level is given in **Table 7**.

Table 7 Classification of Surface water resources, Bhavnagar district, Gujarat state

| Sr. No | Irrigation Dams | River | Catchment area at dam site in Km ² | Full Reservoir Level in m |
|--------|-----------------|-----------------|---|---------------------------|
| 1 | Shetrunji Dam | Shetrunji River | 4317.0 | 54.84 |
| 2 | Rajaval Dam | - | 287.0 | 56.75 |
| 3 | Kharo Dam | Kharo Nadi | 241.06 | 54.12 |
| 4 | Kallubar Dam | Kallubar River | | 47.00 |

CLIMATOLOGY

The area is characterised by tropical climate. Four seasons exists viz. Hot season from March to May, Monsoon season June to September, Post-monsoon season from October to November and Cold season from December to February. The climatological map is given in **Figure 7** and the data is given in **table 8**.

Table 11 Summary of Drought Analysis (1981-2000) - Taluka: Kallubhar, Umralla Taluka.

| No of Years | (1981 – 2000) 20 yrs | Type of Drought | Year of Occurrence | Frequency in % |
|---|---------------------------------|----------------------------|--|---------------------------|
| Average | 458.9 | No Drought | 1981, 83, 84,88,89,90,92,94,97 & 98. | 50 |
| Standard Deviation | 225.78 | Mild | 1985,86,95 & 99 | 20 |
| Coefficient of Variation % | 49.20 | Normal | 1982,1991 & 1993 | 15 |
| Highest Rainfall mm | 1073 | Severe | 1987,1996 & 2000 | 15 |
| Lowest Rainfall mm | 116 | Most Severe | Nil | 0 |

Drought analysis carried out from the rainfall data over a period of 20 years revealed that, the average annual rainfall is 491.58 mm with the highest and the lowest rainfall of 1178 and 196 mm during 1988 and 1987 respectively. The area experienced severe drought during 1987. The coefficient of variation and standard deviation for the rainfall period 1981–2000 was 53.44 % and 262.63.

Though the average annual rainfall is 459 mm/yr. as observed in the table above, the field survey year i.e., 2005 – 06 experienced annual rainfall of about 924 mm which is nearly 50 % more than the normal annual rainfall.

4.2 Temperature

The temperature of the study is varying from 25.7 to 41 ° C during the period March to May. As most of the study area comes within Bhavnagar district, the temperature statistics pertaining to Bhavnagar has been taken for discussion. The coldest month is January wherein the temperature varies between 12.6 to 28.6 ° C. The hottest month is May where the temperature varies between 21.6 to as high as 44.5 (Table 12)

Table 12 Showing the Minimum and Maximum Temperature of the study area.

| Sr. No | Year | January | | May | |
|---------------|-------------|----------------|------------|------------|------------|
| | | Min | Max | Min | Max |
| 1 | 2001 | 12.6 | 28.6 | N.A | 39.8 |
| 2 | 2002 | 28.3 | N.A | 26.9 | 41.1 |
| 3 | 2003 | 28.8 | 15.5 | 23.6 | 40.0 |
| 4 | 2004 | 31.6 | 9.5 | 21.6 | 44.5 |
| 5 | 2005 | 29 | 10.4 | 27.9 | 42.8 |

Source: Statistical Abstract of Gujarat state – 2006.

4.3 Humidity

The relative humidity is about 60 % during monsoon season. During other seasons the air remains relatively dry with relative humidity ranging from 20-30%.

4.4 Wind Velocity

Winds are generally light but become more forceful during the late summer and monsoon season. Winds blow mainly from directions between north-west and north-east during October to April and mostly from the South-West and West during the South-west monsoon season.

GEOLOGY

The generalised geological succession is given in the following table: Geologically, 80% of the area is covered by Basalts and the remaining 20 % by alluvial formation and mudflats.

Table 13 Geological succession of Bhavnagar district, Gujarat state

| Era | Age | Formation | Lithology |
|------------------|----------------------------------|---------------------------|---|
| Quaternary | Recent to Sub-Recent | Surface Soil/ Alluvium | Thick beds of calcareous clay, intercalated with layers of trap sand. |
| --Unconformity-- | | | |
| Tertiary | Lower Eocene to Upper Cretaceous | Deccan trap | Basalt as stratified lava flows comprising amygdaloidal basalt, fine grained porphyritic basalt and basaltic/doleritic dykes. |

5.1 General Geology and Structures

The Deccan trap lava flows is the most extensive geological formation and covers more than 80 % of the study area. In the eastern part, quaternary formation overlies the deccan traps.

5.1.1 Deccan Trap

The Deccan trap encompasses all the intrusive and extrusive acid and basic volcanic formations belonging to upper cretaceous to Paleocene (lower Eocene) age. Deccan traps form highly rugged, undulating to hilly topography and are exposed in the highest reaches, in the western and northern parts rock cut surfaces, nalla courses. In the plain terrain, 1 – 2 m of soils and weathered part cover these formations.

Deccan traps in this area is represented by basalts, both massive and amygdaloidal or vesicular type, dolerite flows, ash beds, basaltic and doleritic dykes. Massive basalt is dark grey or steel grey in colour, very fine grained and compact of basaltic composition.

5.1.2 Dyke

The study area is also characterized by numerous dykes that cut across the prominent feature of the landscape. These dykes vary in thickness/width from less than a metre to more than 15 metres. Number of dykes are traceable for very long distances and are both straight linear and arcuate type, have cut across nature and seams to follow well defined fractures. Fedden (1984) concluded that majority of basaltic flows were derived from fissure eruption, now represented by dykes.

Major part of the district, about 82%, is covered by Deccan Trap lava flows. The trap rock is mostly basalt and dolerite, though, trachytes are also found. at places. The Deccan Trap occurs in the form of lava flows with thickness of individual flows ranging from few meters to more than 30 m. Each individual lava flow can be sub divided into three distinct units - (1) greyish red clay and reddish clayey vesicular basalt, (2) vesicular and amygdaloidal basalt and (3) jointed and massive basalt.

The top of the individual flow is often marked by greyish red to reddish brown clayey material. The thickness of this horizon varies from few centimetres to few metres, at places clayey horizons up to 20 m thickness have also been observed. These horizons are insitu product of weathering and baking of basalt representing a time gap between two successive lava flows. The Vesicular/Amygdaloidal horizons range in thickness from few meters to as much as 10 m. Vesicles were formed due to escape of gas bubbles from the upper part of the flow during cooling of lava. The vesicles are generally filled with secondary minerals like calcite, zeolites and quartz. The lower most horizon of each flow is represented by jointed and massive basalt. This horizon is fine to medium grained, compact dark greenish to grey in colour and forms 60 to 70% of the

flow unit. The upper part of this horizon is often jointed and fractured. At places, the massive basalt is underlain by thin pipe amygdaloidal unit. The lava flows are generally horizontal in disposition. However, in at places, they are found to be dipping by about 7° towards SSE and SSW direction.

The Deccan Trap lava flows have been intruded by a large number of basic and acidic dykes. The basic dykes are generally composed of basalt and dolerite, whereas, the acidic dykes are generally composed of rhyolite and felsite. The doleritic dykes are generally porphyritic in nature. In Saurashtra Region, the dykes generally 2 to 5m thick, but dykes of as much as 250m thickness are also encountered. An acidic dyke, the Kankrej Dyke, is observed north of Shetrunji River near Kankrej. These dykes appear to be structurally controlled are generally oriented in three main directions, i.e., ENE-WSW, E-W and NE-SW.

The joints in Deccan traps are also quite well developed at places. Columnar jointing is also quite common. Principal joint directions observed are N-S, E-W, NE-SW, and NW-SW. The Faults are generally not seen within the basalt out crops, however, there are indications several faults lying below the overlying formations. An east-west trending faults has been observed south of Shetrunji River near trap-alluvium contact. The Deccan traps in the study area include layers of lava flows such as basalt, dolerite, felsite etc.

5.1.3 Quaternary Formations

The Quaternary formations in the area are represented by clays (fuller's earth), marls, limestones. This formation overlies deccan traps.

5.1.4 Recent to Sub-Recent Formations

The recent and sub-recent formations in the district are sand dunes, coastal & beach sands, tidal mud flats, coral reefs occurring in the coastal areas and fresh water alluvium occurring mainly along the rivers and streams.

The alluvium mainly occurs in the central parts of the district along the Shetrunji River. Here it has a thickness ranging from few meters to about 50 m. The alluvium which primarily rests of the basalt mainly comprise of the sand and clays along with the carbonate nodules (kankar) and weathered pieces of basalt. Weathering of basalt has also given rise to black cotton soils and generally it is difficult to distinguish between insitu weathering product of basalt and alluvium.

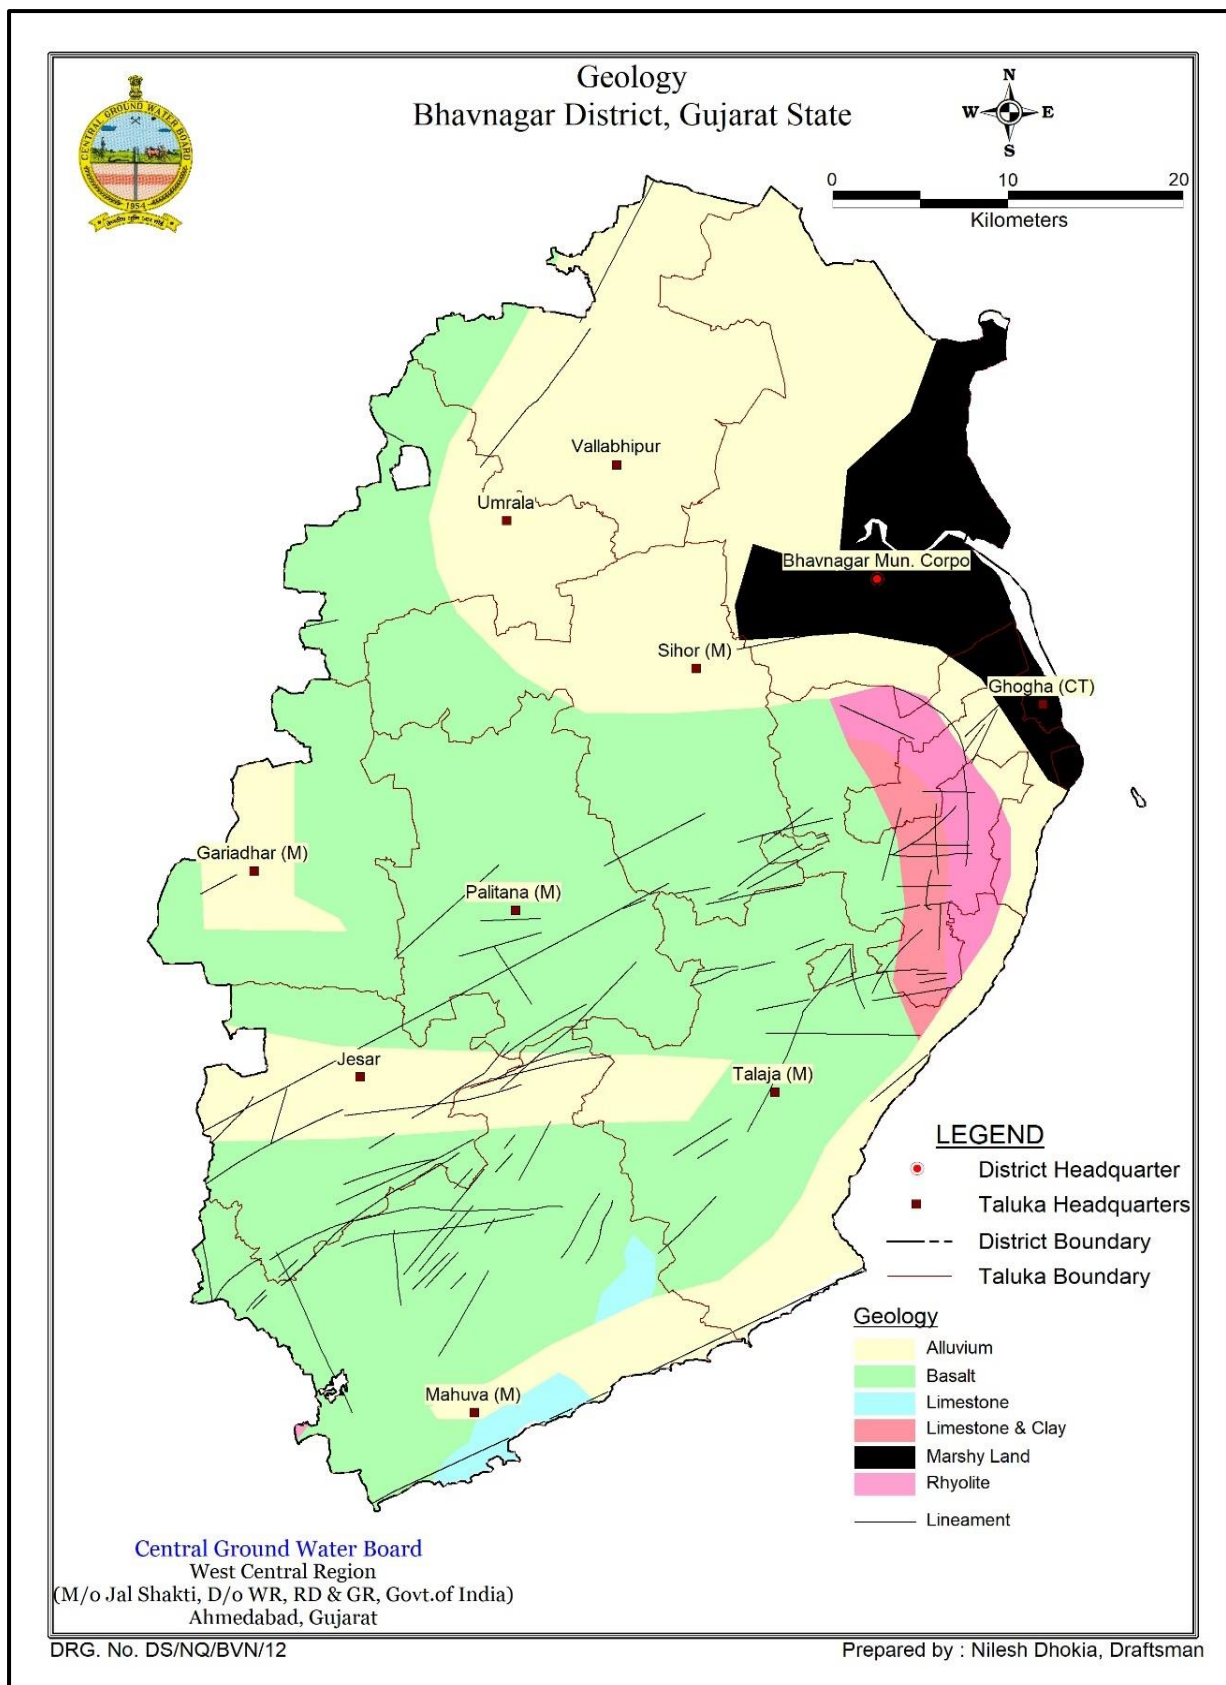

Figure 9 Geological map of Bhavnagar district, Gujarat state

HYDROGEOLOGY

The Deccan trap and Quaternary formations form the aquifer within the district. Groundwater occurs under water table and semi-confined conditions. Dug and dug cum bore well are common structures used for groundwater extraction.

6.1 Quaternary Formation

The area around Panvi in the east has shallow to moderately thick quaternary formation (Post – Miocene) overlying thick Deccan trap. It constitutes about 5 % of the total area covered and consists of clays, marl, chert and sand gravel.

Groundwater in these formations occurs under unconfined conditions. The occurrence and movement of groundwater is controlled by primary as well as secondary porosity.

6.2 Dykes/Lineaments

The presence of many dykes and lineaments in the study area are suggestive of large-scale tectonic disturbances experienced in the past. Dykes generally form linear hills and are demarcated due to relief. The subsurface dykes and fracture do appear in the form of lineament. The dykes in general do not form the aquifer, unless highly fractured and thus mostly act as groundwater barrier. The associated fracture zone and the basaltic formation adjacent to dykes have comparatively higher porosity.

6.3 Deccan Trap

Deccan trap basalt occupies a major part of the district and forms the most extensive aquifer system. It generally forms a poor aquifer due to compactness and poor primary porosity. However, the upper weathered parts, which at places are up to 20 m thick, form good aquifer in the district. At deeper levels, the secondary porosity developed as a result of tectonic activities, in the form of joints, and fractures, shear zones, form repository of groundwater at many places. Amygdaloidal horizons within basalt also form potential aquifers at places. The dykes, both basaltic and doleritic, play an important role in occurrence and movement of groundwater. At places, the dykes are highly weathered and themselves form potential aquifers. At other places where the dykes are more compact, they act as subsurface barrier for the groundwater flow and well-constructed upstream of these dykes have good yields.

6.4 Alluvium

The alluvium forms very potential aquifer, particularly in the central part. The wells in alluvium range in depth from 4 to 50 m bgl. Drilling of horizontal bores in the wells to increase the yields is quite common. Such horizontal bores generally have 2.5 to 5 cm of diameter and extend laterally to 10 to 15 m. The yield of wells ranged between 10 and 820 m³/day.

DATA INTERPRETATION, INTEGRATION AND AQUIFER MAPPING

Collection and compilation of data for aquifer mapping studies is carried out in conformity with Expenditure Finance Committee (EFC) document of XII plan of CGWB encompassing various data generation activities (**Table 14**).

Table 14 Brief activities showing data compilation and generations

| Sr.No | Activity | Sub-activity | Task |
|-------|--|--|--|
| 1 | Compilation of existing data/ Identification | Compilation of Existing data on groundwater. | Preparation of base map and various thematic layers, compilation of information on Hydrology, Geology, Geophysics, Hydrogeology, Geochemical etc. Creation of data base of Exploration Wells, delineation of Principal aquifers (vertical and lateral) and compilation of Aquifer wise water level and draft data etc. |
| | | Identification of Data Gap | Data gap in thematic layers, sub-surface information and aquifer parameters, information on hydrology, geology, geophysics, hydrogeology, geochemical, in aquifer delineation (vertical and lateral) and gap in aquifer wise water level and draft data etc. |
| 2 | Generation of Data | Generation of geological layers (1:50,000) | Preparation of sub-surface geology, geomorphologic analysis, analysis of land use pattern. |
| | | Surface and sub-surface geo-electrical and gravity data generation | Vertical Electrical Sounding (VES), bore-hole logging, 2-D imaging etc. |
| | | Hydrological Parameters on groundwater recharge | Soil infiltration studies, rainfall data analysis, canal flow and recharge structures. |
| | | Preparation of Hydrogeological map (1:50,000 scale) | Water level monitoring, exploratory drilling, pumping tests, preparation of sub-surface hydrogeological sections. |
| | | Generation of additional water quality parameters | Analysis of groundwater for general parameters Including fluoride. |
| 3 | Aquifer Map Preparation (1:50,000 scale) | Analysis of data and preparation of GIS layers and preparation of aquifer maps | Integration of Hydrogeological, Geophysical, Geological and Hydro-chemical data. |
| 4 | Aquifer Management Plan | Preparation of aquifer management plan | Information on aquifer through training to Administrators, NGO's, progressive farmers and stakeholders etc. and putting in public domain. |

7.1 Data Generation

In order to establish the three-dimensional disposition of aquifer system in the area, the existing data of litho logical logs and Electrical logs of Exploratory wells studies carried out and used in prepare a hydro geological cross section, Fence diagram and 3D Model. The data has been analysed using Rockworks 16 software and is presented below in the Hydrogeological cross sections A-A' to E-E' and Solid Model of the district showing the depiction of Aquifer Groups and Aquitard up to 200 m. The stratigraphic sections depicting unconfined aquifer, Confined Aquifer for alluvium and weathered aquifer & fractured aquifer for Basaltic rock are placed at **Figures (11 to 14)**. Fence Diagram and 3D Solid Model of district is depicted in **Figure 15** and **Figure 16**, respectively.

Table 15 Data integration in respect to Bhavnagar district

| Type of Data & source | No of Wells |
|-------------------------------------|--------------|
| Aquifer Disposition | |

7.2 Conceptualization of Aquifer system in 2D

A total of 31 exploratory wells and piezometers lithologs are utilized to decipher the subsurface geometry of the aquifer by using Rockworks 16 software prepared hydro geological cross sections, Fence diagram and 3D Model up to the depth of 200 mbgl. And six hydrogeological cross sections (2D) are drawn in different direction to cover entire area as per the availability of data point in the district and represented in figure 11 (A-A') to figure 16 (F-F').

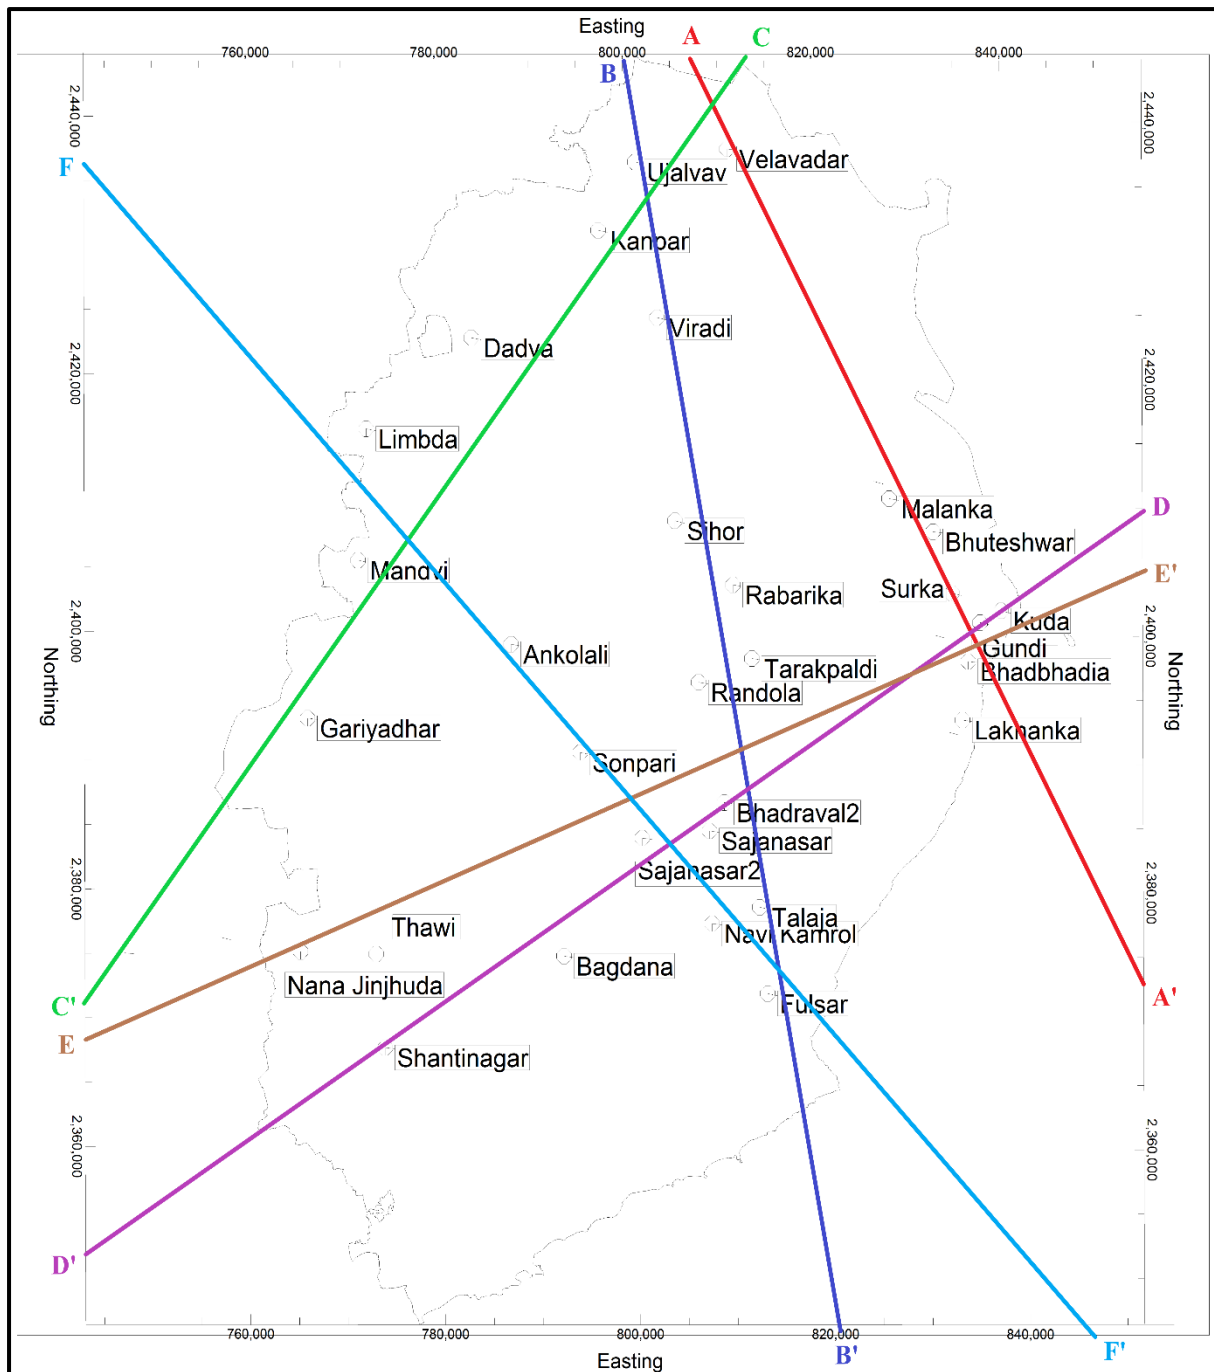

Figure 10 Map showing drawn section lines

1. Section A-A' (Figure 11)- Section is drawn roughly NW-SE direction and in between Velavadar and Laknanka passing through Malanka, Bhuteshwar, Surka, Kuda, Gundi, and Bhadbhadia. Section is represented Stratigraphically; from section it is deciphered that Soft rock formation forms the major aquifer system in the district and rested on the hard rock (fractured/weathered) along drawn section line.

Figure 11 Hydrogeological cross section between Velavadar and Lakhanka (A-A')

2. Section B-B' (Figure 12)- Section is drawn roughly NW-SE direction and in between Ujalvav and Fulsar passing through Viradi, Sihor, Rabarika, Tarakpaldi, Randola, Bhadraval2, and Talaja. Section is represented Stratigraphically; from section it is deciphered that Soft rock and hard rock (fractured/weathered) formation forms the major aquifer system in the district and rested on the hard rock (fractured/weathered) along drawn section line. The Alluvium forms an aquifer system in Ujalvav and Viradi village and Hard rock formation (weathered & fractured) forms the major aquifer system in rest of

Figure 12 Hydrogeological cross section between Ujalvav and Fulsar (B-B')

the villages along drawn section line.

3. Section C-C' (Figure 13)- Section is drawn roughly NE-SW direction and in between Velavadar and Thawi, passing through Ujalvav, Kanpar, Dadva, Limbda, Mandvi, and Gariyadhar. Section is represented Stratigraphically, from section it is deciphered that Alluvium forms an aquifer system in Velavadar, Ujalvav, and Kanpar village of Bhavnagar district and Hard rock formation (weathered & fractured) forms the major aquifer system in rest of the areas along the drawn section line. The alluvium and hard rock (weathered/ fractured) rested on hard rock (weathered/fractured) and massive rock respectively, along

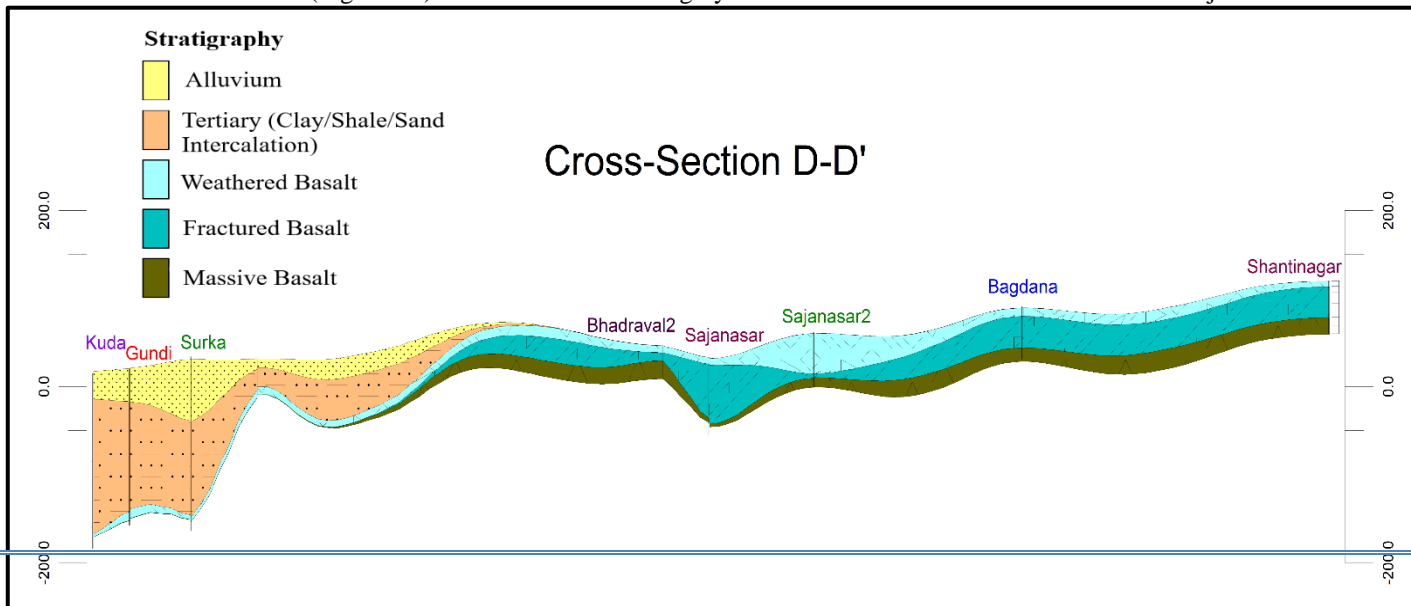

Figure 13 Hydrogeological cross section between Velavadar and Thawi (C-C')

drawn section line.

4. Section D-D' (Figure 14)- Section is drawn roughly NE-SW direction and in between Kuda and Shantinagar, passing through Gundi, Surka, Bhadraval2, Sajanasar, Sajanasar2, and Bagdana. Section is represented Stratigraphically; from section it is deciphered that Hard rock formation (weathered & fractured) forms the major aquifer system in the district and Alluvium forms an aquifer system in Kuda, Gundi, and Surka village. The alluvium and hard rock (weathered/ fractured) rested on hard rock (weathered/fractured) and massive rock respectively, along drawn section line.

Figure 14 Hydrogeological cross section between Kuda and Shantinagar (D-D')

5. Section E-E' (Figure 15)- Section is drawn roughly SW-NE direction and in between Nana Jinjhuda and

Kuda, passing through Thawi, Sonpari, Randola, Tarakpaldi, Bhadbhadia, and Gundi. Section is represented Stratigraphically; from section it is deciphered that Hard rock formation (weathered & fractured) forms the major aquifer system in the district and Alluvium forms an aquifer system in Bhadbhadia, Gundi, and Surka village. The alluvium and hard rock (weathered/ fractured) rested on hard rock (weathered/fractured) and massive rock respectively, along drawn section line.

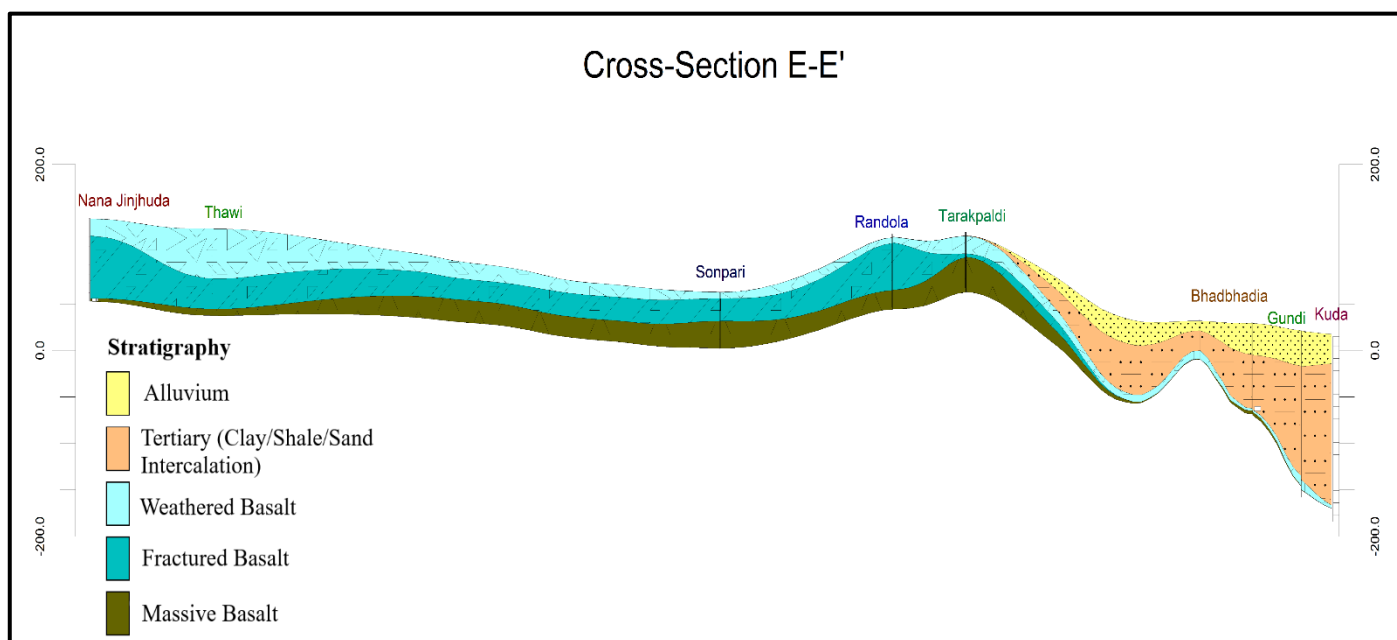

Figure 15 Hydrogeological cross section between Nana Jinjhuda and Kuda (E-E')

6. Section F-F' (Figure 16)- Section is drawn roughly NW-SE direction and in between Limbda and Fulsar, passing through Mandvi, Ankolali, Sonpari, Sajanasar2, Sajanasar, Navi Kamrol, and Talaja. Section is represented Stratigraphically; from section it is deciphered that hard rock formation (weathered & fractured) forms the major aquifer system in the district and rested on massive rock along drawn section

| | Fractured Basalt | | 5 to 86 | 14 to 52 | 4.29 to 37.72 | 680 to 2960 | 0.3 to 6 | 7.41 to 39.88 | Semi-confined | Good quality |

GORUNDWATER SCENARIO

8.1 Quaternary Formation

The area around Panvi in the east has shallow to moderately thick quaternary formation (Post – Miocene) overlying thick Deccan trap. It constitutes about 5 % of the total area covered and consists of clays, marl, chert and sand gravel.

Groundwater in these formations occurs under unconfined conditions. The occurrence and movement of groundwater is controlled by primary as well as secondary porosity. Table below shows the statistics of the dugwells of Vallabhipur taluka that exists within the quaternary formation.

The yield of the dugwells ranged between 170 m³/day to 800 m³/day. Lateral bores are also drilled in the dugwells to enhance the yield.

8.2 Dykes/Lineaments

The presence of many dykes and lineaments in the study area are suggestive of large-scale tectonic disturbances experienced in the past. Dykes generally form linear hills and are demarcated due to relief. The subsurface dykes and fracture do appear in the form of lineament. The dykes in general do not form the aquifer, unless highly fractured and thus mostly act as groundwater barrier. The associated fracture zone and the basaltic formation adjacent to dykes have comparatively higher porosity.

8.3 Deccan Trap

Deccan trap basalt occupies a major part of the district and forms the most extensive aquifer system. It generally forms a poor aquifer due to compactness and poor primary porosity. However, the upper weathered parts, which at places are up to 20 m thick, form good aquifer in the district. At deeper levels, the secondary porosity developed as a result of tectonic activities, in the form of joints, and fractures, shear zones, form repository of groundwater at many places. Amygdaloidal horizons within basalt also form potential aquifers at places. The dykes, both basaltic and doleritic, play an important role in occurrence and movement of groundwater. At places, the dykes are highly weathered and themselves form potential aquifers. At other places where the dykes are more compact, they act as subsurface barrier for the groundwater flow and well-constructed upstream of these dykes have good yields.

The groundwater in basalt occurs under phreatic to confined conditions. The groundwater is generally tapped through dug wells varying in depth from 5 to 30 m. At places, dug-cum-bored wells are also constructed by drilling bores below the bottom of dug wells. The yield of dug wells and dug-cum-bored wells in basalt generally range from 100 to 500 m³/day. During Rabi (post monsoon) season these wells sustain intermittent pumping of 15 minutes to 12 hours, however, during summer, the yield of these wells is considerably diminished. The vesicular & amygdaloidal horizons within basalt at places may have yields of up to 1000 m³/day.

The dykes occurring in the district form aquifers at places wherever they are highly fractured. The wells in such dykes range in depth between 5 and 25 m and the yield of wells range between 15 and 600 m³/day.

8.4 Alluvium

The alluvium forms very potential aquifer, particularly in the central part. The wells in alluvium range in depth from 4 to 50 m bgl. Drilling of horizontal bores in the wells to increase the yields is quite common. Such horizontal bores generally have 2.5 to 5 cm of diameter and extend laterally to 10 to 15 m. The yield of wells ranged between 10 and 820 m³/day.

8.5 Basalt

The **basalts** are moderately weathered to 2 – 5 m bgl. The groundwater occurs within the less to moderately jointed basalts. The yield of the dugwells in the basaltic terrain is 200 – 250 m³/day. The sp. Yield

varied between 0.3 % to 14 % with an aquifer transmissivity varying between 2 and 250 m²/day. At places, highly productive zones are encountered and are attributed to the secondary porosity developed by fracturing or interflow zones. The groundwater quality is generally good with the EC varying between 300 and 2000 μ S/cm.

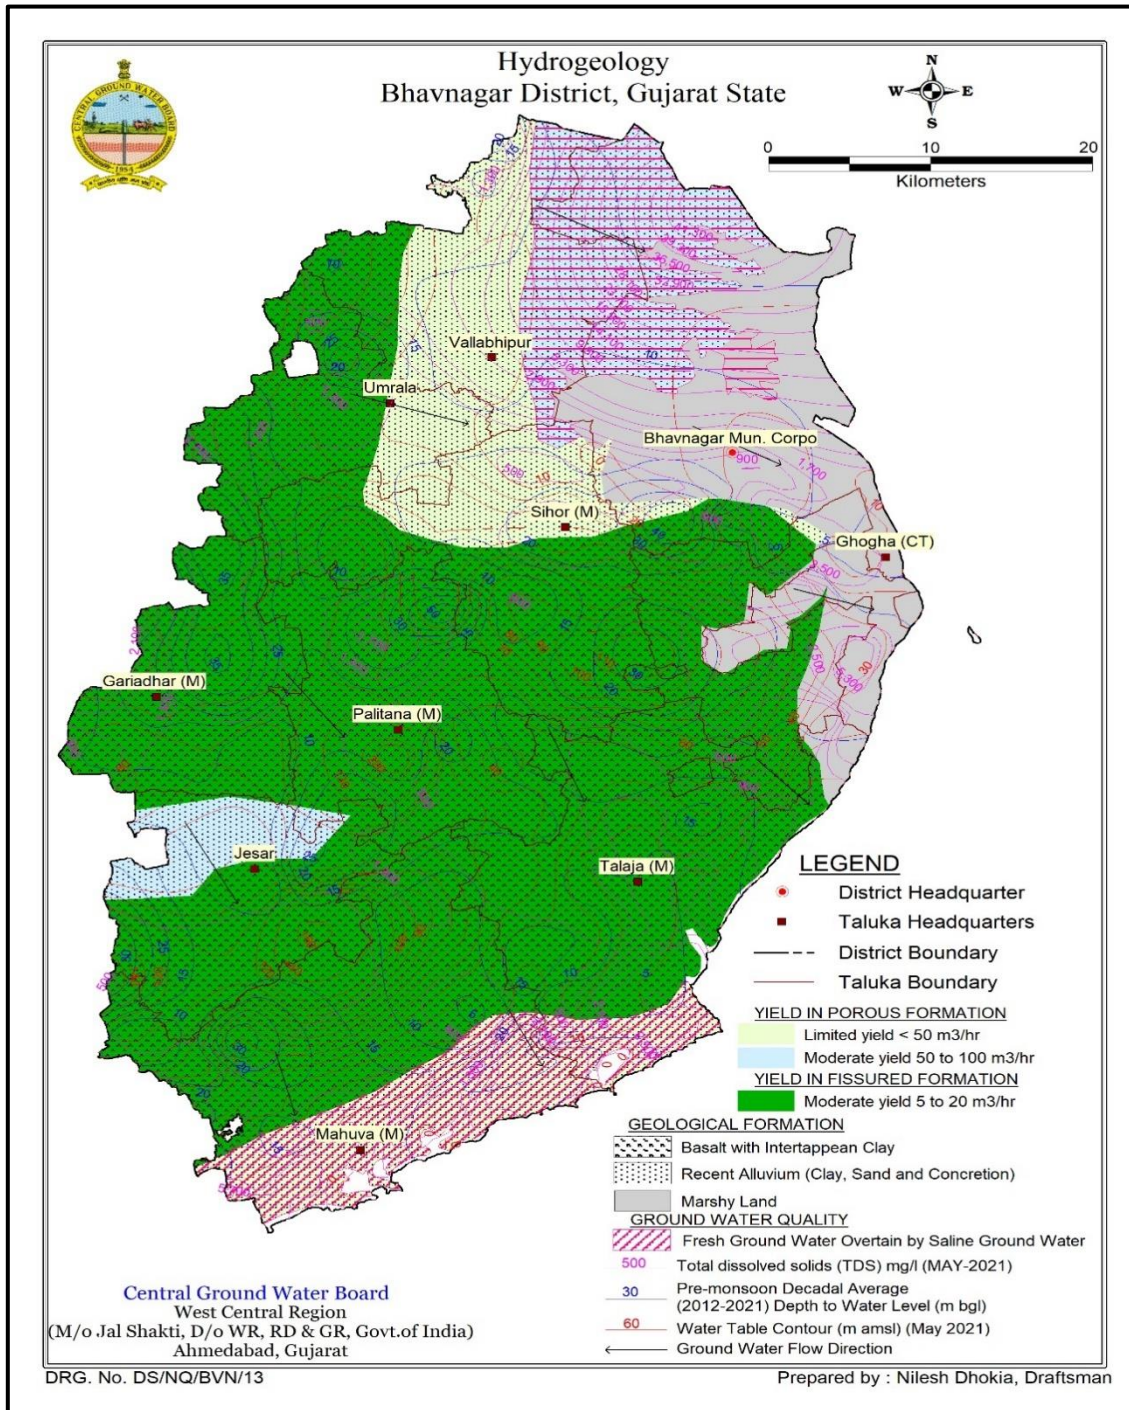

Figure 19 Map showing the Hydrogeological setup of Bhavnagar District

GROUNDWATER REGIME MONITORING

Ground water regime monitoring is the basic component of groundwater management, and it is carried out in Bhavnagar district four times a year, during January, May, August and November through 42 National Hydrograph Network Stations (NHS) and also for NAQUIM studies Pre-Monsoon and Post-Monsoon (2021). Depth to water level map of pre monsoon and post monsoon period and annual fluctuation of water level are prepared with data of NHS.

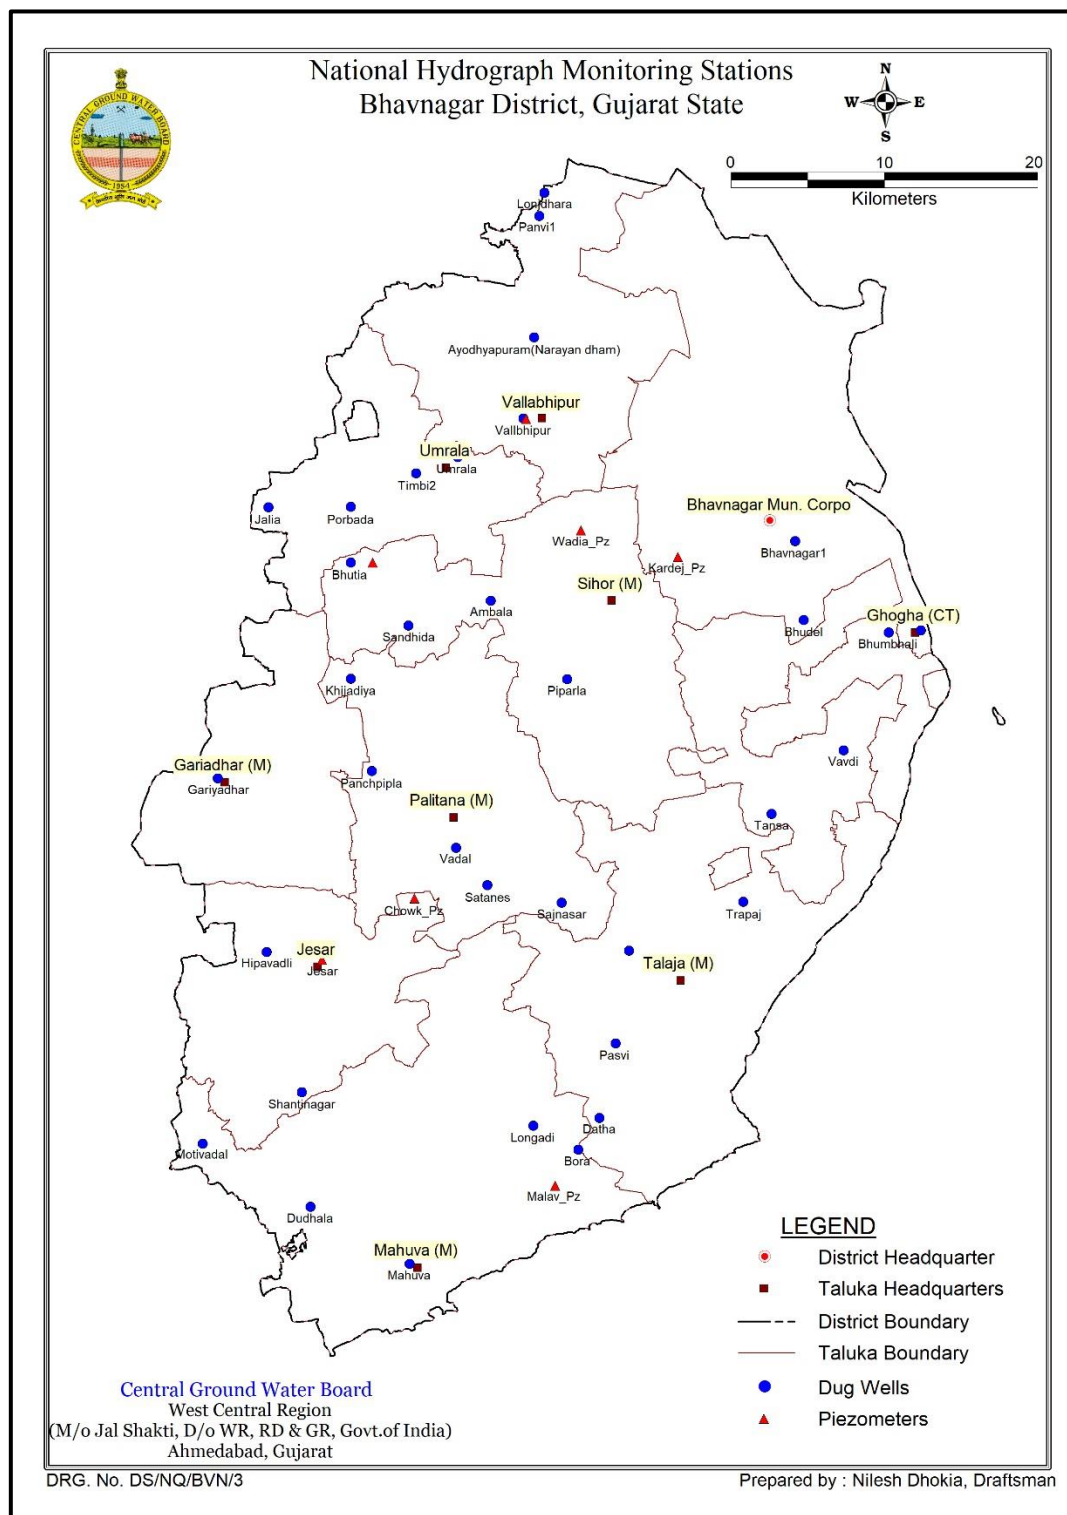

Figure 20 National Network of Hydrograph Stations of Bhavnagar District

9.1 Behaviour of Water Levels

The behaviour of water levels was studied based on the water level data collected from the National Network of Hydrograph Stations (NNHS). The water level data of May 2021 and November 2021 was used for preparing the depth to water level maps. The seasonal fluctuation in water levels was calculated between May and November 2021. Total 167 nos. of monitoring stations including 87 nos. monitoring station of Gujarat Water Resources Development Corporation (GWRDC) were taken during preparation of maps.

9.1.1 Depth to Water Level (Pre-monsoon)

Pre monsoon depth to water levels of Bhavnagar district is shown in the (**Figure 19**), which depict that water levels in most part of the district ranges in between 05m bgl to 20m bgl. Small patch in boundary region of Bhavnagar-Ghogha, Sihor-Palitana, and Gariyadhar-Umralla taluka shows deeper water level of more than 20 m bgl. Bhavnagar taluka shows small patch of water level deeper than 40m bgl. Shallow water level is observed in patches in almost all talukas of the district.

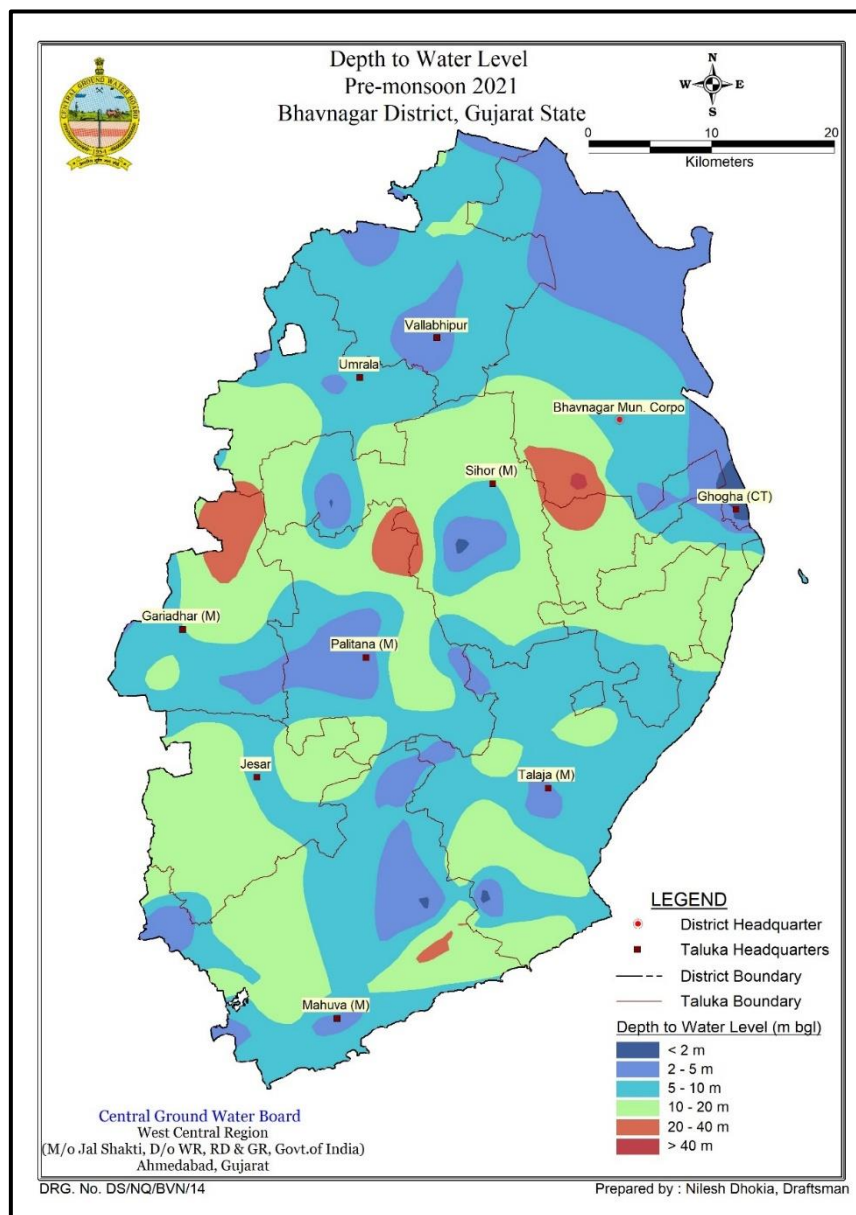

Figure 21 Pre-monsoon (May 2021) depth to water level of Bhavnagar District

9.1.2 Depth to Water Level (Post-monsoon)

Post-monsoon water level as shown below in map for the period of November, 2021 (**Figure 20**) shows that shallow water level up to 5.0 m bgl are observed in most part of the district which reflect good recharge were taken place due to rainfall. Water level between 5m bgl to 10m bgl is observed in patches in almost all talukas of the district. Small patch in boundary region of Bhavnagar-Sihor, Palitana-Jesar, Mahuva-Talaja, and in Ghogha taluka shows water level between 10m bgl to 20 m bgl. Bhavnagar taluka shows small patch of water level deeper than 40m bgl.

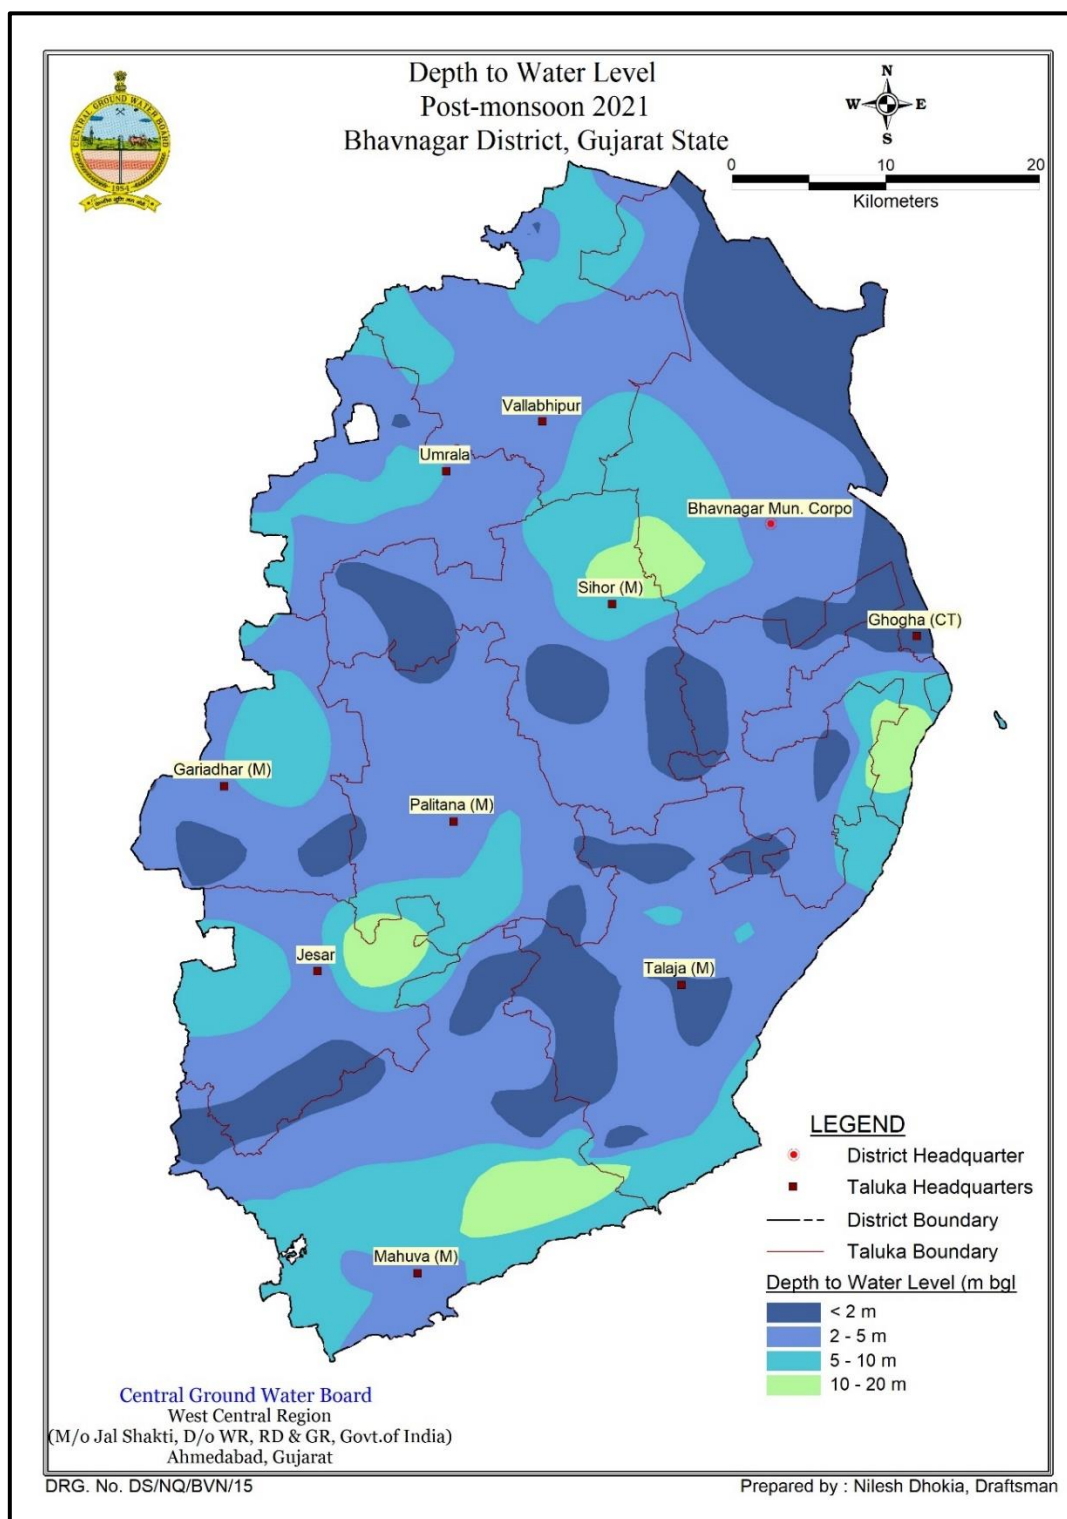

Figure 22 Post-monsoon (November 2021) depth to water level of Bhavnagar District

9.1.3 Water level Fluctuation

The fluctuation of water levels between Pre-monsoon (May, 2021) and Post Monsoon (November, 2021) shows in **Figure 21**. Most parts of the district have registered rise in water levels i.e., >4m. Major area of Vallabhipur and Bhavnagar taluka shows water level rise up to 4m. A few localized pockets in Sihor, Palitana, Jesar, Talaja taluka, and most part of district boundary also indicate water level rise up to 4m.

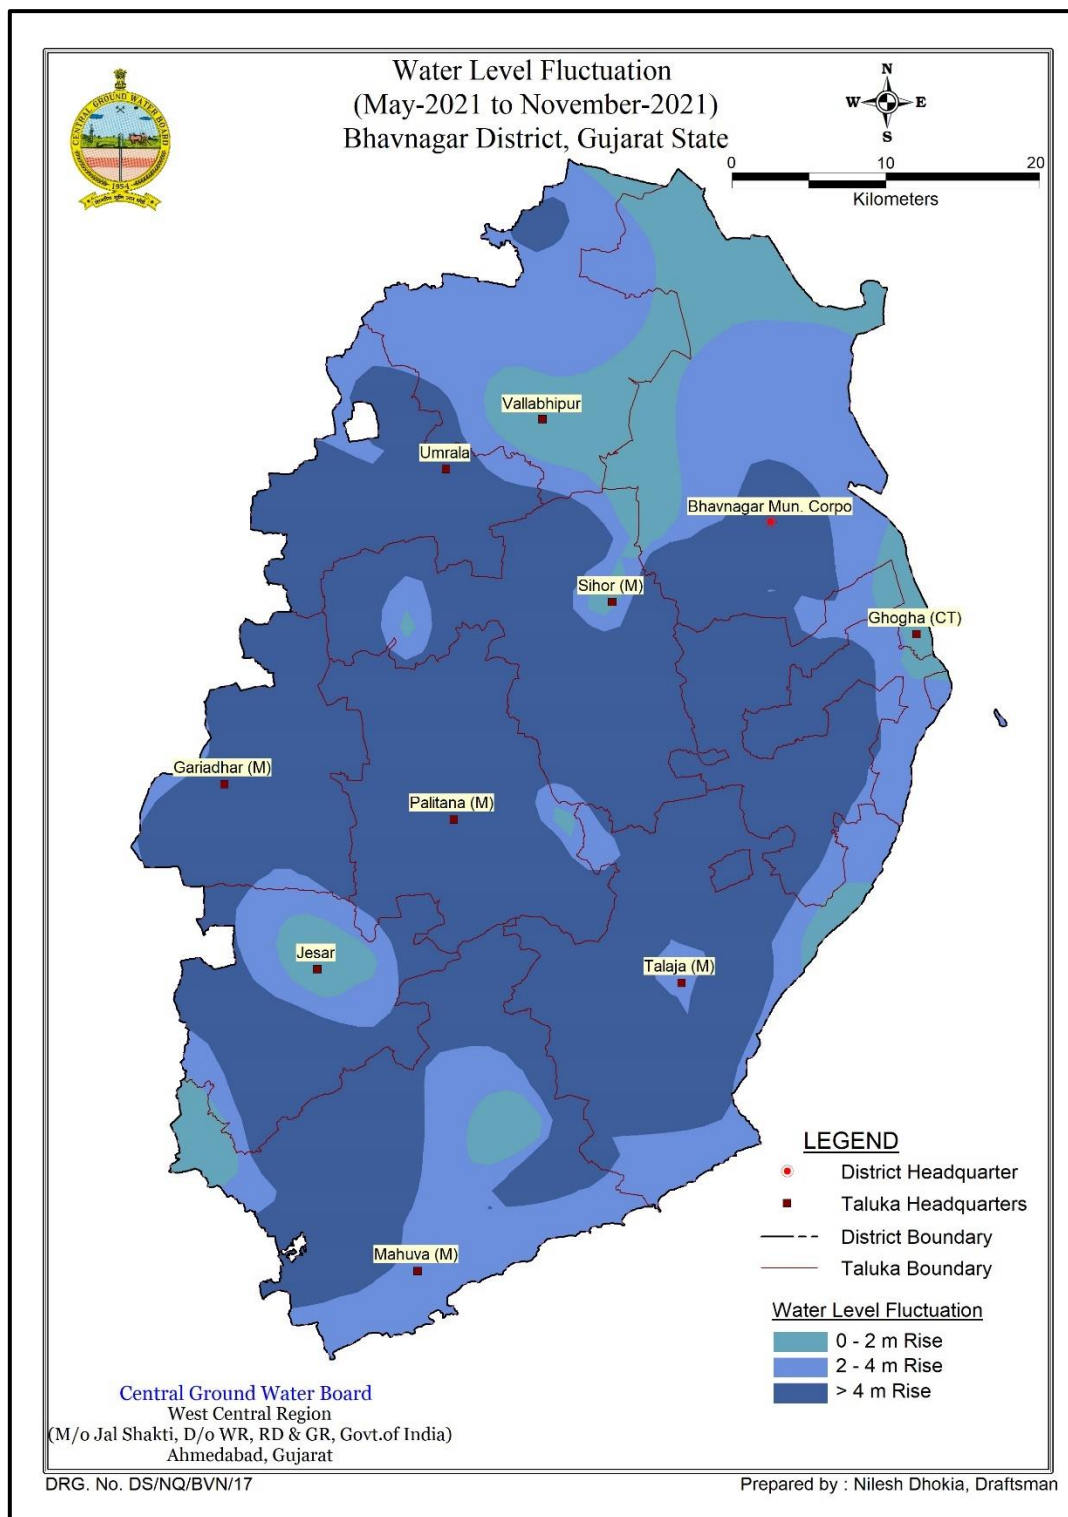

Figure 23 Water Level Fluctuation Bhavnagar District

9.1.4 Decadal water level trend

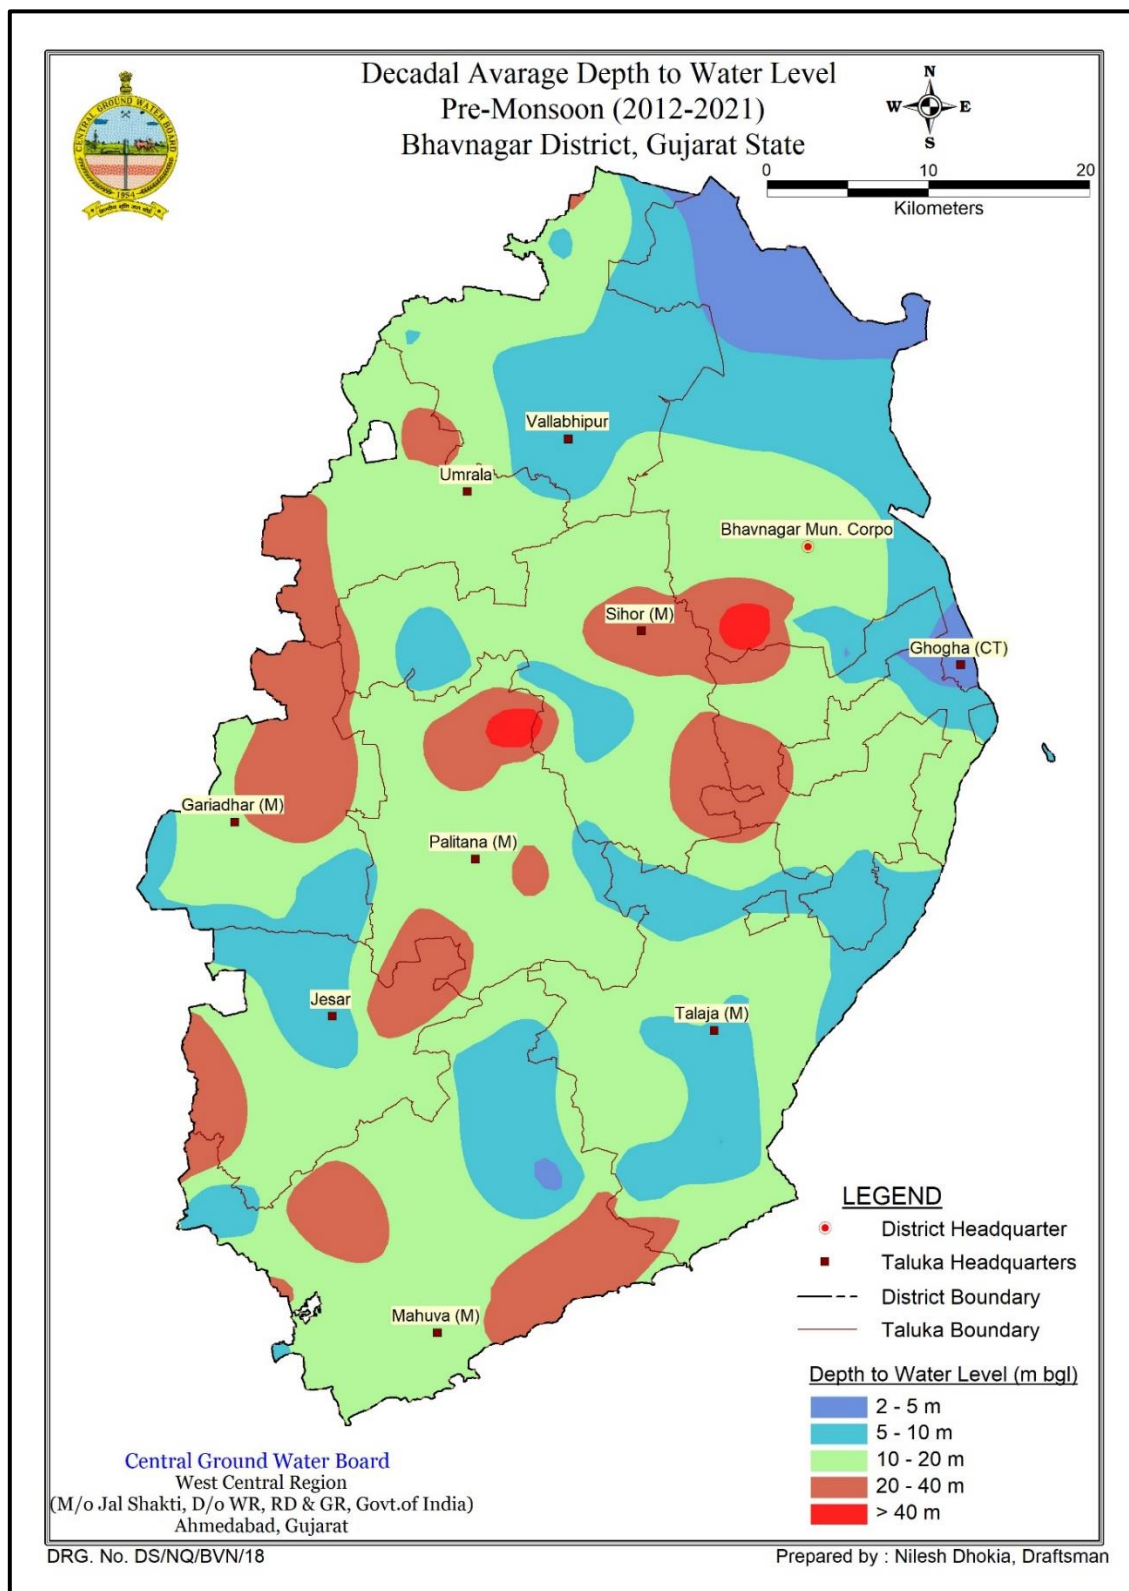

Figure 24 Ground water decadal trend Pre-monsoon (2012-2021), Bhavnagar district, Gujarat

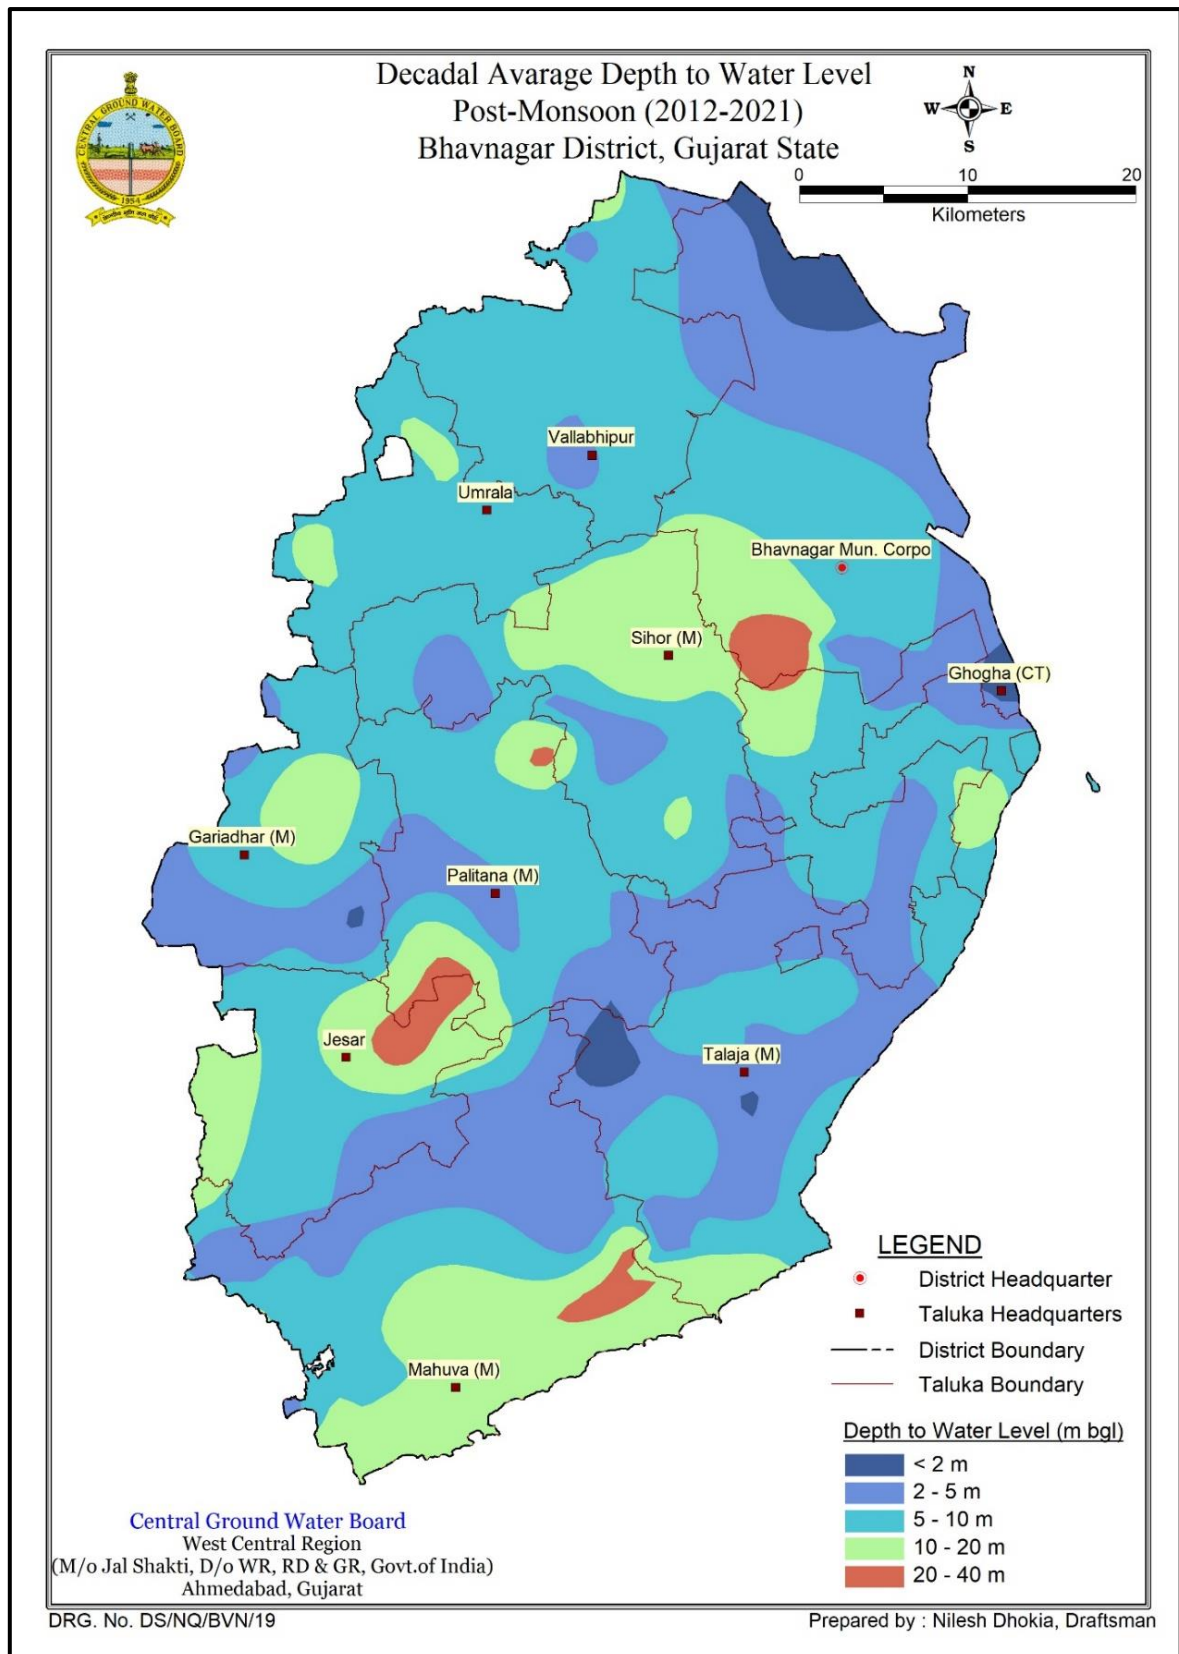

Figure 25 Ground water decadal trend Post-monsoon (2012-2021), Bhavnagar district, Gujarat

9.2 Decadal water level trend and Hydrograph

From the analysis of the water level trend of the Botad district from 2012 to 2021, it is observed that, during pre-monsoon, the water level has a rise of 0.089127 m/yr (Tansa) to 0.923064 m/yr (Timbi) and also has a fall of 0.027672 m/yr (Porbada) to 0.61704 m/yr (Bhumbhali). Similarly, from the analysis of the post-monsoon data of 2012 to 2021, the water level has a rise of 0.084790 m/yr (Ghogha) to 1.52 m/yr. (Mahuva) and there is no fall in water level trend in post-monsoon season in the district. Pre-monsoon and Post-monsoon long-term rising and declining trend of water level of various hydrograph stations established by CGWB are also studied in graphic form. Majority of the hydrographs are showing rising trends during the pre-monsoon period and there is no falling trend in post monsoon period. However, falling trend in few hydrographs is also observed in pre-monsoon season.

9.3 Water Table and Groundwater Movement

The elevation of water table in Pre-monsoon 2021 is observed higher along eastern boundary of Jesar, southern side of Palitana, and along SE boundary of Sihor taluka. The above areas show dome shape water table contour elevation from where the flow direction is towards all the sides. The highest water table contour elevation is observed in Palitana taluka i.e., 240 amsl to 130 amsl (**Figure 43**). Northern area of district i.e., Vallabhipur, Bhavnagar, Umralla, and northern part of Sihor taluka exhibit lower water table contour elevation. Similarly, eastern side of Mahuva, Talaja, and Ghogha taluka shows lower water table contour elevation. The overall trend of flow direction of the district is towards SE direction.

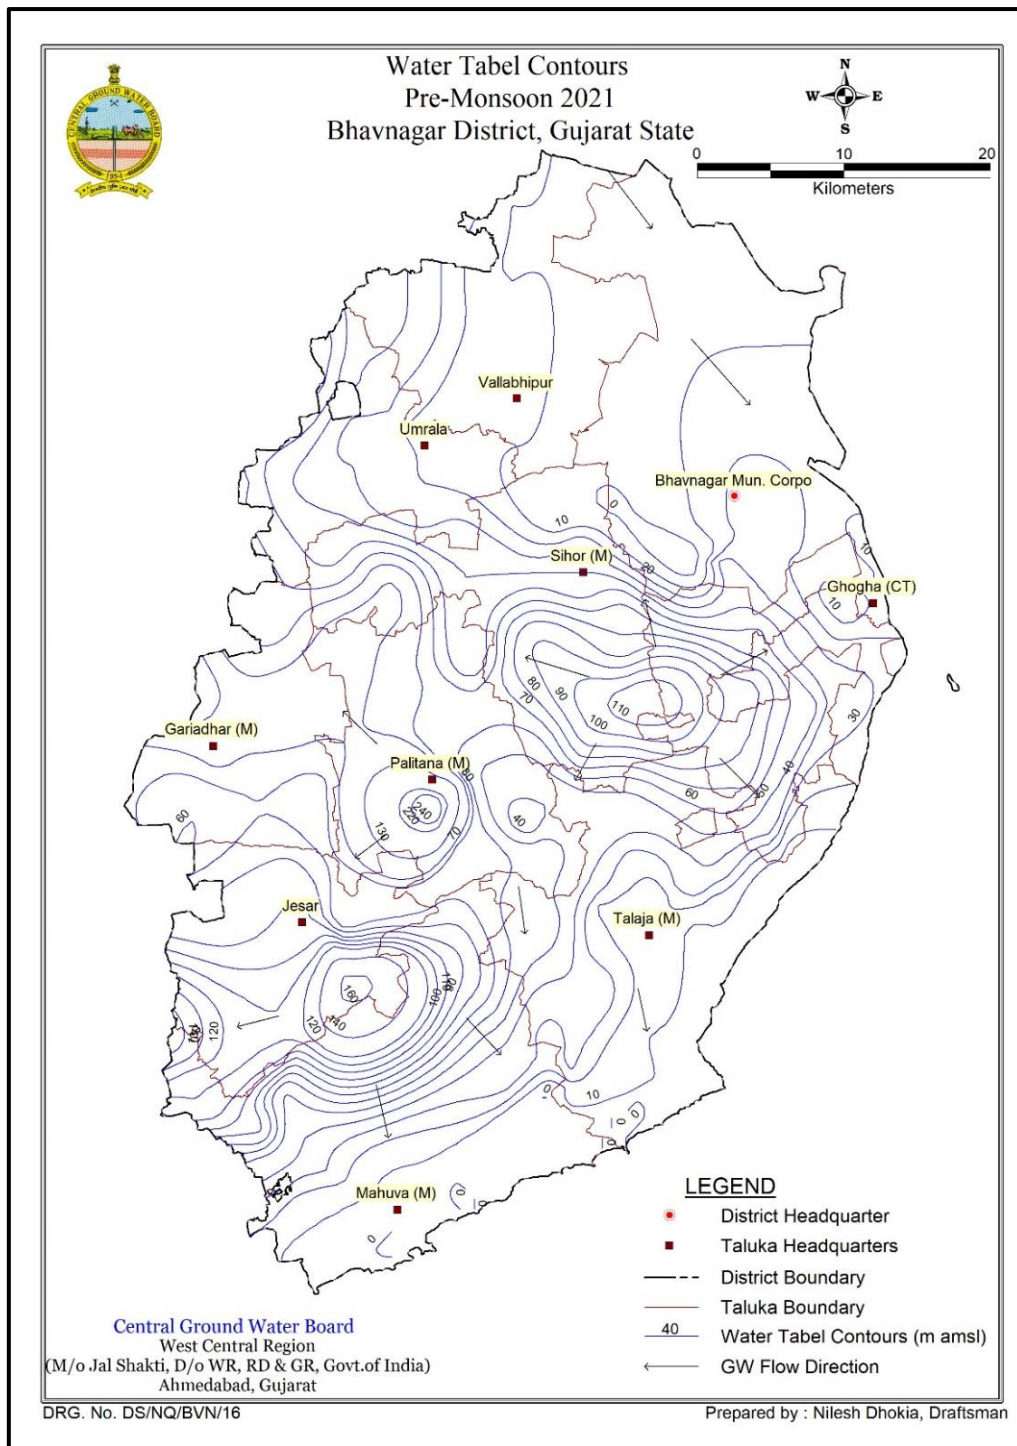

Figure 43 Water level contour map (Pre-monsoon_2021)

GROUND WATER RESOURCE POTENTIAL

The ground water resources of the district were calculated as on May 2021 in collaboration with the Government of Gujarat using the GEC-2015 methodology suggested by Ground Water Resource Estimation Committee (GWRE-2017). These resources were computed after reorganization of the districts, talukas of the district are considered as Assessment Unit (AU) and total area of 6693.9 km² are taken as area of assessment of the district including 10 talukas. Computed resource is presented in tabulated (Table 19) and graphically represented as below.

Table 18 Taluka wise Ground Water resources, Availability, Utilization and Stage of Ground Water Development

| Mahuva | 71.858 | 7.5 | 79.36 | 4.35 |
| Palitana | 57.298 | 3.82 | 61.12 | 4.01 |
| Sihor | 66.061 | 3.52 | 69.58 | 6.15 |
| Talaja | 75.174 | 5.4 | 80.58 | 1.63 |
| Umralla | 34.51 | 1.43 | 35.94 | 1.51 |
| Vallabhipur | 13.881 | 1.17 | 15.05 | 1.41 |
| District Total | 430.98 | 32.54 | 463.52 | 46.59 |

10.1 Ground Water Recharge

Total Annual Ground Water Recharge from Rainfall and other sources for both monsoon and non-monsoon season for the district is 1025.03 mcm. And ground water recharge in talukas varies from 49.22 mcm (Vallabhipur taluka) to 184.7 mcm (Sihor taluka).

10.2 Net Ground Water Availability

Annual Extractable Ground Water Resource/ Net Ground Water Availability of the district is 973.78 mcm which computed after deducting total natural discharge of 51.25 mcm from total annual ground water recharge.

10.3 Annual Ground Water Draft

The gross ground water draft for all uses (i.e., Irrigation, Domestic and Industrial uses) in the district is 422.63 mcm. The existing gross ground water extraction for all uses varies from 13.96 mcm (Vallabhipur taluka) to 79.09 mcm (Talaja taluka). According to annual groundwater draft, 2017, approximately 93% of ground water extraction are used for Irrigational purposes, remaining 7% are being extracted mainly for Domestic and Industrial purposes.

10.4 Projected demand for Domestic and Industrial use up to 2025

As per the annual Ground Water Resource Potential, 2017, the total Projected demand of ground water for Domestic and Industrial uses in the district is 46.59 mcm. Projected demand for domestic uses varies from 1.41 mcm (Vallabhipur taluka) to 14.86 mcm (Bhavnagar taluka).

10.5 Ground water Availability for future Irrigation

Net ground water availability for future use in the district is 551.08 mcm. Taluka wise it varies from 22.89 mcm (Umralla taluka) to 114.78 mcm (Sihor taluka).

10.6 Stage of Ground Water Extraction

As per the Ground Water Resource Estimation (GWRE-2017), the stage of Ground Water extraction of the district is 43.4% which categorized as Safe. Whereas in taluka it varies from 24.7% (Bhavnagar taluka) to 62.02% (Talaja taluka) and all the 10 talukas of the district are categorized as SAFE.

HYDROCHEMISTRY

Groundwater in the district is in general potable and fresh, both in phreatic and confined aquifers within 200 m depth.

The chemical quality of groundwater in shallow aquifer of the district has been analysed based on the water samples collected during National Hydrographs Monitoring Stations (NHS) and NAQUM in May 2021 from CGWB and

Chemical data from Gujarat Water Resources Development Corporation (GWRDC) were also incorporated, and presented in **Table 20**. The ground water is in general alkaline in nature.

Table 19 Statistical Analysis of Chemical Constituents of Ground Water in Bhavnagar District, May 2021.

| Constituents | Minimum | Maximum | Average |
|-------------------------|---------|---------|---------|
| pH | 7.18 | 9 | 8.19 |
| EC (uS/cm) | 542 | 16000 | 2444.15 |
| Alkalinity (mg/l) | 70 | 1350 | 413.08 |
| TH (mg/l) | 70 | 3850 | 545.06 |
| TDS (mg/l) | 363 | 10720 | 1637.64 |
| CO ₃ (mg/l) | 0 | 300 | 41.38 |
| HCO ₃ (mg/l) | 73 | 1257 | 419.82 |
| Cl (mg/l) | 28 | 5213 | 411.29 |
| SO ₄ (mg/l) | 5 | 1083 | 135.27 |
| NO ₃ (mg/l) | 6.38 | 2352 | 121.94 |
| Ca (mg/l) | 12 | 640 | 84.41 |
| Mg (mg/l) | 0 | 559.36 | 81.24 |
| Na (mg/l) | 2.6 | 2096.2 | 312.01 |
| K (mg/l) | 0.02 | 63 | 2.24 |
| F (mg/l) | 0.21 | 2.75 | 69 |
| SiO ₂ (mg/l) | 15.04 | 101 | 53.73 |
| SAR | 0.06 | 39.45 | 6.9 |

11.1 Hydrogen Ion Concentration (pH)

The pH is an indicator of acidity of the water. The shallow ground water in the district is generally alkaline with pH more than 7. The value of pH ranges between 7.18 (Bhavnagar1 site) & 9.0 (Malvav village) in the district.

11.2 Iso Conductivity Map

As per the BIS standards [IS 10500: 2012] for drinking water, acceptable limit and permissible limit of Total Dissolve Solid (TDS) are 500 mg/l and 2000 mg/l respectively.

Iso conductivity Map of the district shown below in (**Figure 44**), EC in the district is mostly lie within Permissible limit. Most of the area of Vallabhipur taluka shows TDS value above permissible limit. Small patches of TDS value above permissible limit are visible in Sihor-Palitana boundary, Palitana Gariadhar taluka, and Mahuva taluka. The TDS value above 5000 mg/l is exhibited in southern section of mahuva taluka.

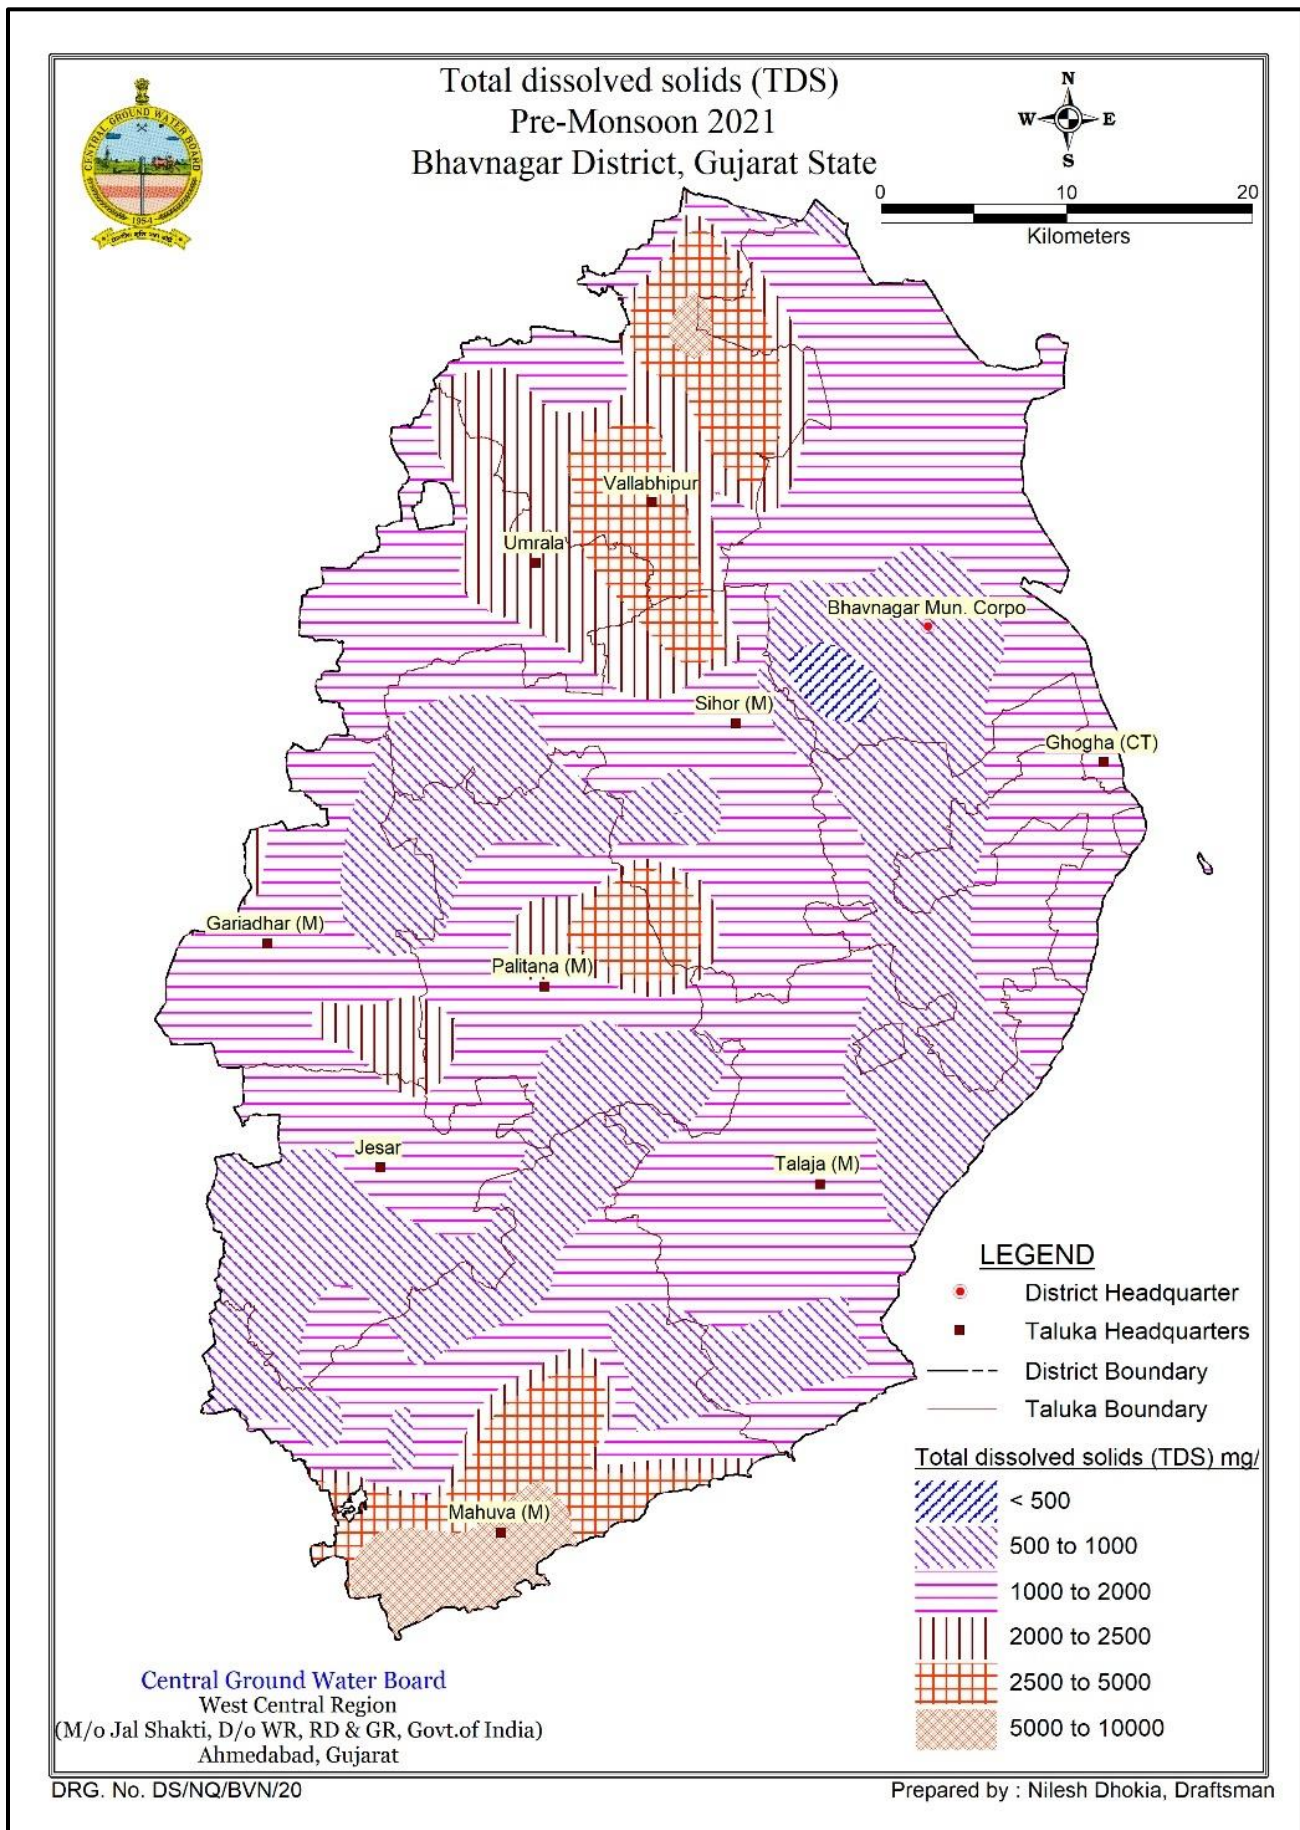

Figure 44 Map showing Taluka wise Total Dissolved Solid (TDS) values of Bhavnagar District.

11.3 Electrical conductivity (EC)

The electrical conductivity is a measurement of how easily a material allows electric current to flow through. The electrical conductivity of ground water varies from 542 mg/l (Kardej village) to about 16000 mg/l (Devaliya village).

11.4 Carbonate (CO₃) and Bicarbonate (HCO₃)

Carbonate and bicarbonate anions contribute to alkalinity due to their basic nature. The carbonate concentration in district are varies in between zero mg/l (38 locations) to 300 mg/l (Padrod village). Similarly, Bicarbonate concentration in district are varies in between 73 mg/l (Timbi2) to 1257 mg/l (Umralla village).

11.5 Map of Chloride (Cl)

As per the BIS standards [IS 10500: 2012] for drinking water, acceptable limit and permissible limit of Chloride (mg/l) are 250 mg/l and 1000 mg/l respectively. It is depicted from the map shown in **Figure 45**, A very small patches in Mahuva and Vallabhipur taluka shows Cl concentration is more than permissible limit.

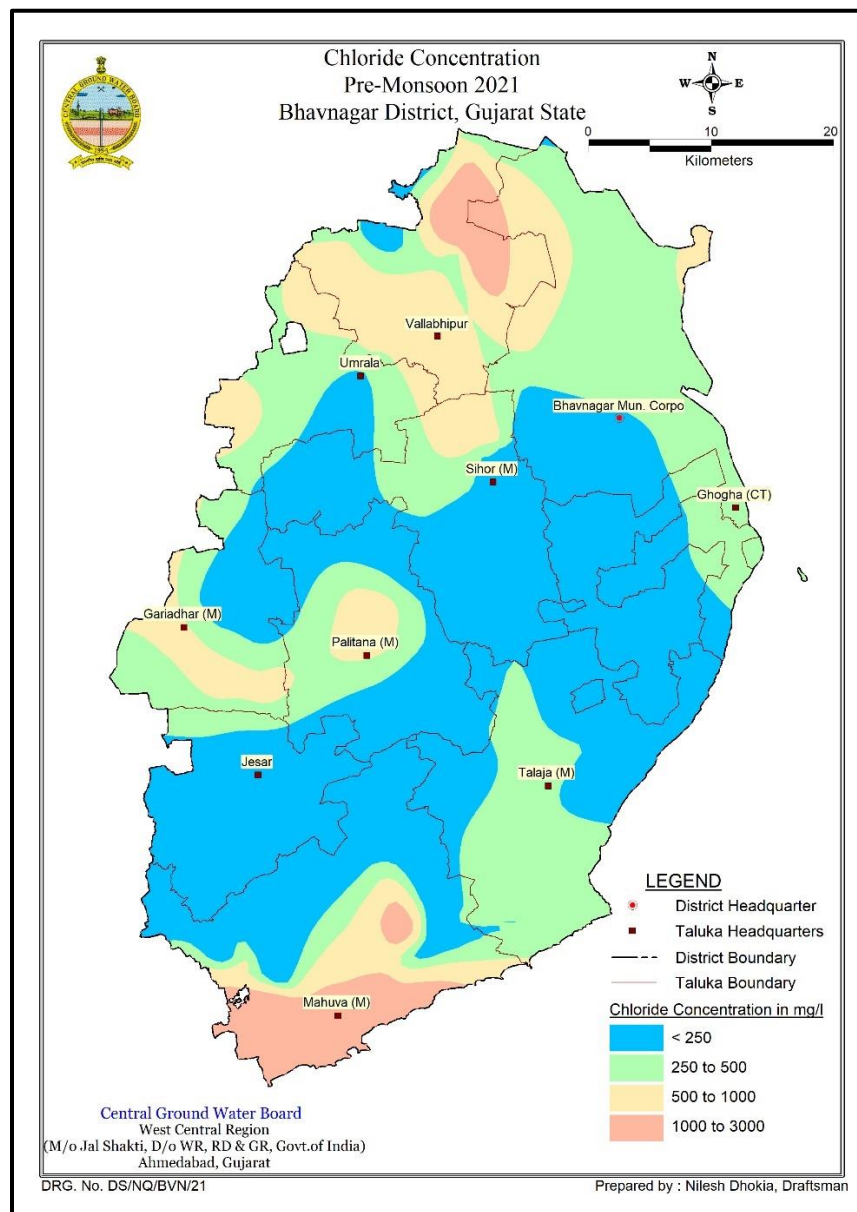

Figure 45 Map showing Taluka wise Chloride (Cl) concentration in Bhavnagar District.

11.6 Nitrate (NO₃)

As per the BIS standards [IS 10500: 2012] for drinking water, acceptable limit is 45 mg/l (maximum) and there is no relaxation in permissible limit.

Nitrate concentration in the ground water in district varies between 6.38 mg/l (Longadi village) and 2352 mg/l (Randola village). Majority of the stations show nitrate concentration above acceptable limit (**Figure 46**). All the stations of Bhavnagar taluka show nitrate concentration below 45 mg/l.

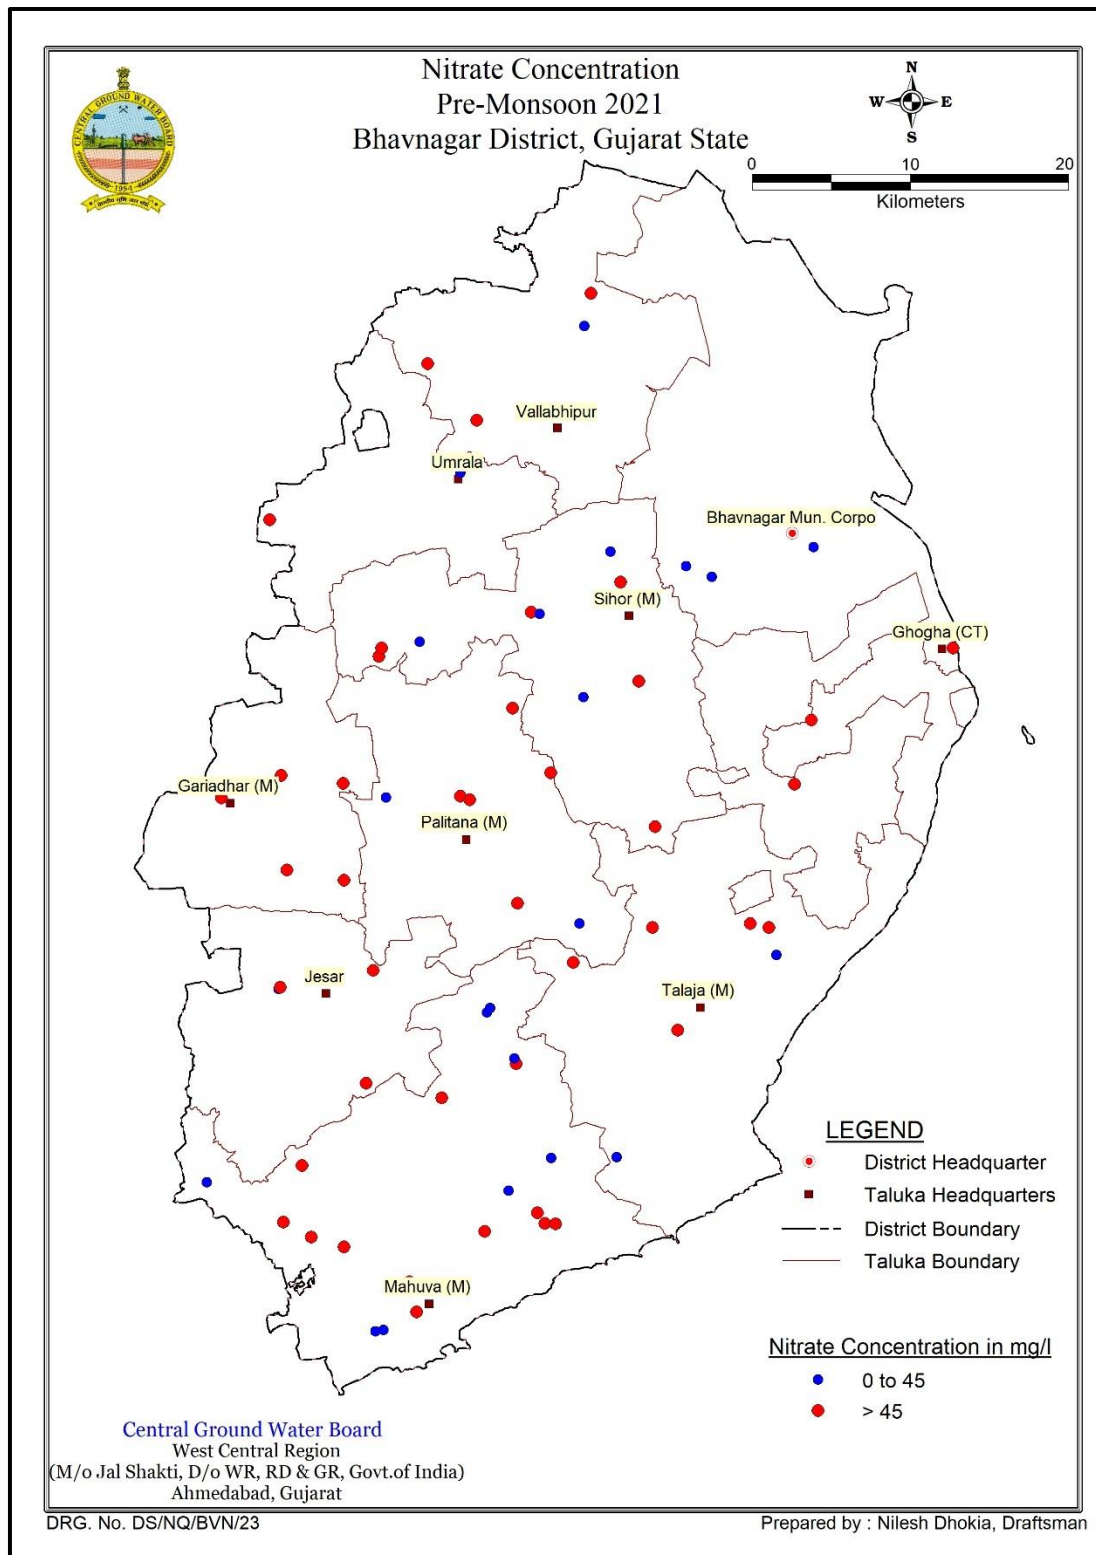

Figure 46 Map showing Taluka wise Nitrate (NO₃) concentration in Bhavnagar District.

11.7 Sulphate (SO₄)

In the district, Sulphate concentration varies from 5 mg/l (Kardej village) to 1083 mg/l (Bhavani Nagar location).

11.8 Fluoride (F)

As per the BIS standards [IS 10500: 2012] for drinking water, Acceptable limit and Permissible limit of Fluoride (mg/l) are 1 mg/l and 1.5 mg/l respectively. Fluoride concentration in Bhavnagar district varies in between 0.21 mg/l (Dharai village) and 2.75 mg/l (Bora village). There are 03 isolated locations where Fluoride concentration is more than permissible limit as presented in **Figure 47**.

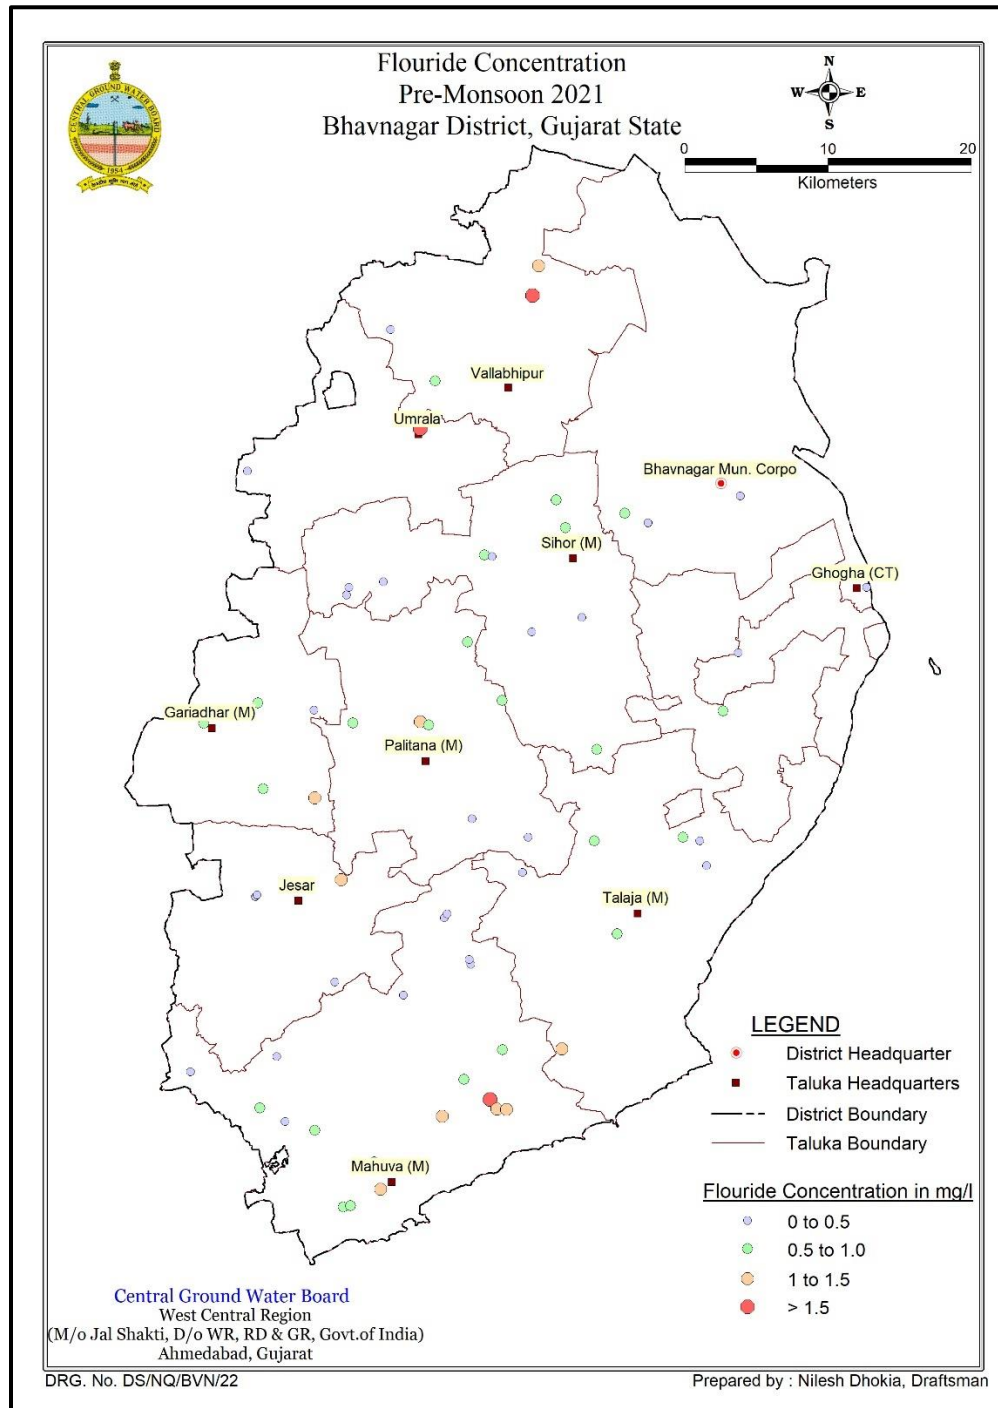

Figure 47 Map showing Taluka wise Fluoride (F) concentration in Bhavnagar District.

11.9 Calcium (Ca)

Calcium concentration in district varies between 12 mg/l (Bora village) and 640 mg/l (Devaliya village). The concentration of calcium is found within permissible limits in the district (permissible limit as per BIS norms is 200 mg/l) except 03 location i.e., Jalia, Varal, and Devaliya village.

11.10 Magnesium (Mg)

The Concentration of Magnesium in areas ranges from zero mg/l (Varal village) to 559.36 mg/l (Randola village). In 17 locations namely Kajavadar, Bhavani Nagar, Jalia, Padroad, Palitana, Talaja2, Satapada, Moti Dharai, Gariyadhar, Senjadiya, Bhandaria, Dudhala, Varal, Dharai, Dudadhar, Devaliya, Randola, the concentration of Magnesium is more than maximum permissible limits of 100 mg/l (as per BIS norms).

11.11 Sodium (Na)

Sodium concentration in the district varies between 2.6 mg/l (Kukad village) and 2096.2 mg/l (Bhavani Nagar site).

11.12 Potassium (K)

The concentration of Potassium in shallow ground water ranges from 0.02 mg/l (Umralla village) to 63 mg/l (Ghogha site).

SUSTAINABLE GROUNDWATER DEVELOPMENT AND MANAGEMENT

12.1 Groundwater related issue:

12.1.1 Low Ground water development

As per GWRE 2020 the total ground water resources of the district are in order of 102503.1 Ham/year and utilizable resources are 97377.93 Ham/year. The net annual drafts of 42263.25 Ham/year leaves a balance of 55114.68 Ham/year of ground water available for future development.

Low Ground water Development: Stage of Ground water development of the district is 43.43%, however talukas wise it ranges from 24.7% (Bhavnagar taluka) to 62.02% (Talaja taluka).

12.1.2 Pollution (Geogenic and Anthropogenic)

Ground water in both shallow and deeper Aquifers is Potable and fit for domestic, drinking, irrigation and other industrial purposes and Occurrence of Fluoride and Nitrate beyond acceptable limit (As per the BIS standards [IS 10500: 2012] for drinking water) in Shallow aquifers identified in localized isolated villages.

12.1.3 Sustainability

Groundwater in these formations occurs under unconfined conditions. The occurrence and movement of groundwater is controlled by primary as well as secondary porosity. The yield of the dugwells ranged between 170 m³/day to 800 m³/day. Lateral bores are also drilled in the dugwells to enhance the yield.

The groundwater in basalt occurs under phreatic to confined conditions. The groundwater is generally tapped through dug wells varying in depth from 5 to 30 m. At places, dug-cum-bored wells are also constructed by drilling bores below the bottom of dug wells. The yield of dug wells and dug-cum-bored wells in basalt generally range from 100 to 500 m³/day. The dykes occurring in the district form aquifers at places wherever they are highly fractured. The wells in such dykes range in depth between 5 and 25 m and the yield of wells range between 15 and 600 m³/day.

12.1.4 Reasons for Issues

The groundwater related issues in Bhavnagar district are

- In Bhavnagar district, the overall stage of groundwater development is moderate (68.04 %), however, there is constraint of quality in the coastal areas and low yield in inland hard rock areas. Rapid urbanization and concurrent industrial activities are affecting ambient hydrogeological regime lately.
- District receives monsoon rainfall of 580 mm during SW monsoon, large number of artificial recharge structure are present in the district. The structures need maintenance at regular interval so as to reap the benefit for Time to come.
- There are relatively high ground water development along coastal zones, which also have limited thickness of good quality aquifer system. Sustainable groundwater management strategy to conserve existing resources and preventive actions to control contamination of freshwater resources are essential. Periodic monitoring of ground water should be mandatory

12.2 Management Strategies

As per the estimate of ground water resources and irrigation potential, there exists a scope for further development of ground water resources in major parts of the district. As per GWRE 2017 all the ten (10) talukas of the district are under **safe** category. Stage of Ground water development of the district is 43.4%, however taluka wise it ranges from 24.7% (Bhavnagar village) to 62.02% (Talaja village).

Thus, further ground water development could be augmented in a judicious way.

12.3 Management plan

The uneven distribution of groundwater availability and its utilization indicates that a single management strategy cannot be adopted and requires integrated hydrogeological aspects along with socio-economic conditions to develop appropriate management strategy. The study suggests notable measures for sustainable groundwater management, which involves a combination of various measures given below.

- Ground water development Plan
- Supply side measures
- Demand side measures
- Regulatory measures
- Institutional measures

12.3.1 Ground water Development Plan

To elevate the stage of ground water development to 46.04% in all blocks, 5840 nos. of Dug wells (15m depth) are proposed as feasible extraction structures **Table 21**. The extraction structures will result as expected annual ground water draft of 2920 Ham which will create 6488.89 Ha additional irrigation potential in the district.

Table 20 Feasible Extraction structures to elevate the Stage of GW development to 46.04% (Hard Rock)

| Extraction Talukas | Feasible Extraction structures to elevate the Stage of GW development to 46.04% | | G.W Draft from Extraction structures (ham) | Additional Irrigation Potential Created (Ha) |
|-----------------------|---|-------|--|---|
| | DW | Total | | |
| Bhavnagar | 183 | 183 | 92 | 203.33 |
| Gariadhar | 565 | 565 | 283 | 627.78 |
| Ghogha | 463 | 463 | 232 | 514.44 |
| Jesar | 250 | 250 | 125 | 277.78 |
| Mahuva | 1174 | 1174 | 587 | 1304.44 |
| Palitana | 386 | 386 | 193 | 428.89 |
| Sihor | 617 | 617 | 309 | 685.56 |
| Talaja | 1549 | 1549 | 775 | 1721.11 |
| Umrالا | 417 | 417 | 209 | 463.33 |
| Vallabhipur | 238 | 238 | 119 | 264.44 |
| District | 5840 | 5840 | 2920 | 6488.89 |

12.3.2 Supply side interventions

As per Master Plan 2020, surplus surface water of 20 mcm non committed is allocated to suggest artificial recharge in district of Bhavnagar. To harvest the surface water the artificial recharge structures are proposed to recharge the aquifer. Expected annual Groundwater recharge is 2043.2 Ham through Recharge Shaft of total 667 nos. are recommended for harvesting the part of available runoff and to recharge the Groundwater as in **Table 22**.

Table 21 Proposed Artificial Recharge and WUE Interventions in Bhavnagar District

| Recharge Talukas | Artificial Recharge through Recharge Shaft | Additional Recharge from Recharge interventions (ham) |
|---------------------|---|--|
| Bhavnagar | 31 | 94.8 |
| Gariadhar | 58 | 177.4 |
| Ghogha | 47 | 143.7 |
| Jesar | 37 | 113.4 |
| Mahuva | 125 | 382.4 |
| Palitana | 70 | 215.7 |
| Sihor | 89 | 273.1 |
| Talaja | 141 | 430.9 |
| Umrالا | 43 | 135.6 |
| Vallabhipur | 25 | 76.4 |
| District | 667 | 2043.4 |

12.3.3 Demand side intervention

Feasible extraction structures are proposed to elevate the stage of ground water development to 46.04%, to avoid further exploitation demand side management is also recommended to restrict the stage of ground water development to 45.06%. An area of 421.98 Ha is proposed for on farm activities (Laser levelling/Bench terracing/Contour banding), and 2986 no of farm ponds are recommended which will serve dual purpose of irrigation and recharge to ground water. Conservation of water from on-farm activities, WUE measures and farm ponds is 944.13 ham.

➤ Farm Ponds

A farm pond is a large hole dug out in the earth, usually square or rectangular in shape (**Figure 48**), which harvests rainwater and stores it for future use. It has an inlet to regulate inflow and an outlet to discharge excess water. The pond is surrounded by a small bund, which prevents erosion on the banks of the pond. The size and depth depend on the amount of land available, the type of soil, the farmer's water requirements, the cost of excavation, and the possible uses of the excavated earth. Water from the farm pond is conveyed to the fields manually, by pumping, or by both methods.

Figure 48 Schematic diagram of Farm Pond

Advantages of Farm Ponds

- They provide water to start growing crops, without waiting for rain to fall.
- They provide irrigation water during dry spells between rainfalls. This increases the yield, the number of crops in one year, and the diversity of crops that can be grown.
- Bunds can be used to raise vegetables and fruit trees, thus supplying the farm household with an additional source of income and of nutritious food.
- Farmers are able to apply adequate farm inputs and perform farming operations at the appropriate time, thus increasing their productivity and their confidence in farming.
- They check soil erosion and minimize siltation of waterways and reservoirs.
- They supply water for domestic purposes and livestock
- They promote fish rearing.
- They recharge the ground water.
- The excavated earth has a very high value and can be used to enrich soil in the fields, levelling land, and constructing farm roads.

Table 22 Projected Stage Groundwater Resource and Management plan of Bhavnagar District

| Projected Status of Groundwater Resource after implementation of GW Management Plan, Bhavnagar District (Gujrat) | | | | | | | | | | | | | | | | |

CONCLUSION AND RECOMMENDATIONS

- Artificial recharge structures like recharge shaft is proposed in the district to encounter needed surface runoff.
- To elevate the stage of ground water development to 46.04% in district, 5840 no. of Dug wells (15 m depth) are proposed as feasible extraction structures.
- The extraction structures will result as expected annual ground water draft of 2920 Ham which will create 6488.89 Ha additional irrigation potential in the district.
- To prevent Over Exploitation, water conservation activities like on farm and farm pond activities are recommended.
- 421.98 Ha area is proposed for on farm activities (Laser levelling/Bench terracing/Contour banding) and 2986 no of farm ponds are recommended which will serve dual purpose of irrigation and recharge to ground water.
- Ground water return flow of 759.2 Ham is expected from irrigation of fields in the district.
- 944.13 ham conservation of ground water through WUE measures, on farm activities & farm ponds is expected for the district.
- As a conservation measure, farmers should be encouraged and educated to adopt modern irrigation techniques like drip, sprinkler irrigation etc. to effect minimum withdrawal and maximum utilisation of groundwater.
- The water quality in general is good. However higher EC, Nitrate and fluoride concentration is observed in isolated pockets. Ground water in such areas may be used after blending with surface water. In areas where ground water has higher concentration of Nitrate is observed, necessary sanitation measures should be adopted.
- Taking into consideration of tribal domination and drought prone area, the 'Mass Awareness Programme' and 'Water Management Training Programme' should be organized in regular basis in the district for awareness on the depletion of groundwater resources and quality problems.
- Present supply side interventions are suggested based on availability 20 MCM non committed source of water is referred by State Government (Reference Master Plan of Artificial recharge 2020). Proposed enhancements of present Groundwater development stage are subjected to implementation of recharge interventions, availability of cultivable land and yield of Groundwater structures.
- These interventions also need to be supported by regulation, so that the ground water resources are protected for future generation and also serve as ground water sanctuary in times of distress/drought. IEC activities and capacity building activities needs to be aggressively propagated to establish the institutional framework for participatory ground water management.
